The Programs (which include both the software and documentation) contain proprietary information; they are provided under a license agreement containing restrictions on use and disclosure and are also protected by copyright, patent, and other intellectual and industrial property laws. Reverse engineering, disassembly, or decompilation of the Programs, except to the extent required to obtain interoperability with other independently created software or as specified by law, is prohibited.

The information contained in this document is subject to change without notice. If you find any problems in the documentation, please report them to us in writing. This document is not warranted to be error-free. Except as may be expressly permitted in your license agreement for these Programs, no part of these Programs may be reproduced or transmitted in any form or by any means, electronic or mechanical, for any purpose.

If the Programs are delivered to the United States Government or anyone licensing or using the Programs on behalf of the United States Government, the following notice is applicable:

U.S. GOVERNMENT RIGHTS Programs, software, databases, and related documentation and technical data delivered to U.S. Government customers are "commercial computer software" or "commercial technical data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the Programs, including documentation and technical data, shall be subject to the licensing restrictions set forth in the applicable Oracle license agreement, and, to the extent applicable, the additional rights set forth in FAR 52.227-19, Commercial Computer Software—Restricted Rights (June 1987). Oracle Corporation, 500 Oracle Parkway, Redwood City, CA 94065

The Programs are not intended for use in any nuclear, aviation, mass transit, medical, or other inherently dangerous applications. It shall be the licensee's responsibility to take all appropriate fail-safe, backup, redundancy and other measures to ensure the safe use of such applications if the Programs are used for such purposes, and we disclaim liability for any damages caused by such use of the Programs.

Oracle, JD Edwards, PeopleSoft, and Retek are registered trademarks of Oracle Corporation and/or its affiliates. Other names may be trademarks of their respective owners.

The Programs may provide links to Web sites and access to content, products, and services from third parties. Oracle is not responsible for the availability of, or any content provided on, third-party Web sites. You bear all risks associated with the use of such content. If you choose to purchase any products or services from a third party, the relationship is directly between you and the third party. Oracle is not responsible for: (a) the quality of third-party products or services; or (b) fulfilling any of the terms of the agreement with the third party, including delivery of products or services and warranty obligations related to purchased products or services. Oracle is not responsible for any loss or damage of any sort that you may incur from dealing with any third party.

Index

Preface

This Preface contains these topics:

- Audience
- Documentation Accessibility
- Related Documents
- Conventions

Audience

Oracle Application Server Adapter for SAP R/3 User's Guide is intended for those who perform the following tasks:

- install applications
- maintain applications

To use this document, you need to know how to install and configure Oracle BPEL Process Manager.

Documentation Accessibility

Our goal is to make Oracle products, services, and supporting documentation accessible, with good usability, to the disabled community. To that end, our documentation includes features that make information available to users of assistive technology. This documentation is available in HTML format, and contains markup to facilitate access by the disabled community. Accessibility standards will continue to evolve over time, and Oracle is actively engaged with other market-leading technology vendors to address technical obstacles so that our documentation can be accessible to all of our customers. For more information, visit the Oracle Accessibility Program Web site at

<http://www.oracle.com/accessibility/>

Accessibility of Code Examples in Documentation

Screen readers may not always correctly read the code examples in this document. The conventions for writing code require that closing braces should appear on an otherwise empty line; however, some screen readers may not always read a line of text that consists solely of a bracket or brace.

Accessibility of Links to External Web Sites in Documentation

This documentation may contain links to Web sites of other companies or organizations that Oracle does not own or control. Oracle neither evaluates nor makes any representations regarding the accessibility of these Web sites.

TTY Access to Oracle Support Services

Oracle provides dedicated Text Telephone (TTY) access to Oracle Support Services within the United States of America 24 hours a day, seven days a week. For TTY support, call 800.446.2398.

Related Documents

For more information, refer to these Oracle resources:

- *Oracle Application Server Adapter Concepts*
- *Oracle Application Server Adapters Installation Guide*
- *Oracle Application Server Containers for J2EE User's Guide*

Printed documentation is available for sale in the Oracle Store at

<http://oraclestore.oracle.com/>

To download free release notes, installation documentation, white papers, or other collateral, please visit the Oracle Technology Network (OTN). You must register online before using OTN; registration is free and can be done at

<http://www.oracle.com/technology/membership/>

If you already have a user name and password for OTN, then you can go directly to the documentation section of the OTN Web site at

<http://www.oracle.com/technology/documentation/>

Conventions

This section describes the conventions used in the text and code examples of this documentation set. It describes:

- Conventions in Text
- Conventions in Code Examples
- Conventions for Windows Operating Systems

Conventions in Text

We use the following conventions in text to help you more quickly identify special terms. The table also provides examples of their use.

Convention	Meaning	Example
Bold	Bold typeface indicates terms that are defined in the text or terms that appear in a glossary, or both.	When you specify this clause, you create an index-organized table .
<i>Italics</i>	Italic typeface indicates book titles or emphasis.	<i>Oracle Database Concepts</i> Ensure that the recovery catalog and target database do <i>not</i> reside on the same disk.

Convention	Meaning	Example
UPPERCASE monospace (fixed-width) font	Uppercase monospace typeface indicates elements supplied by the system. Such elements include parameters, privileges, datatypes, Recovery Manager keywords, SQL keywords, SQL*Plus or utility commands, packages and methods, as well as system-supplied column names, database objects and structures, user names, and roles.	You can specify this clause only for a NUMBER column. You can back up the database by using the BACKUP command. Query the TABLE_NAME column in the USER_TABLES data dictionary view. Use the DBMS_STATS.GENERATE_STATS procedure.
lowercase monospace (fixed-width) font	Lowercase monospace typeface indicates executable programs, filenames, directory names, and sample user-supplied elements. <i>Note:</i> Some programmatic elements use a mixture of UPPERCASE and lowercase. Enter these elements as shown.	Enter sqlplus to start SQL*Plus. The password is specified in the orapwd file. Back up the datafiles and control files in the /disk1/oracle/dbs directory. The department_id, department_name, and location_id columns are in the hr.departments table. Connect as oe user. The JRepUtil class implements these methods.
lowercase italic monospace (fixed-width) font	Lowercase italic monospace font represents placeholders or variables.	You can specify the <i>parallel_clause</i> . Run <i>old_release.SQL</i> where <i>old_release</i> refers to the release you installed prior to upgrading.

Conventions in Code Examples

Code examples illustrate SQL, PL/SQL, SQL*Plus, or other command-line statements. They are displayed in a monospace (fixed-width) font and separated from normal text as shown in this example:

```
SELECT username FROM dba_users WHERE username = 'MIGRATE';
```

The following table describes typographic conventions used in code examples and provides examples of their use.

Convention	Meaning	Example
[]	Anything enclosed in brackets is optional.	DECIMAL (<i>digits</i> [, <i>precision</i>])
{ }	Braces are used for grouping items.	{ENABLE DISABLE}
	A vertical bar represents a choice of two options.	{ENABLE DISABLE} [COMPRESS NOCOMPRESS]
...	Ellipsis points mean repetition in syntax descriptions. In addition, ellipsis points can mean an omission in code examples or text.	CREATE TABLE ... AS <i>subquery</i> ; SELECT <i>col1</i> , <i>col2</i> , ... , <i>coln</i> FROM employees;
Other symbols	You must use symbols other than brackets ([]), braces ({ }), vertical bars (), and ellipsis points (...) exactly as shown.	acctbal NUMBER(11,2); acct CONSTANT NUMBER(4) := 3;
<i>Italics</i>	Italicized text indicates placeholders or variables for which you must provide particular values.	CONNECT SYSTEM/ <i>system_password</i> DB_NAME = <i>database_name</i>

Convention	Meaning	Example
UPPERCASE	Uppercase typeface indicates elements supplied by the system. We show these terms in uppercase in order to distinguish them from terms you define. Unless terms appear in brackets, enter them in the order and with the spelling shown. Because these terms are not case sensitive, you can use them in either UPPERCASE or lowercase.	<pre>SELECT last_name, employee_id FROM employees; SELECT * FROM USER_TABLES; DROP TABLE hr.employees;</pre>
lowercase	<p>Lowercase typeface indicates user-defined programmatic elements, such as names of tables, columns, or files.</p> <p>Note: Some programmatic elements use a mixture of UPPERCASE and lowercase. Enter these elements as shown.</p>	<pre>SELECT last_name, employee_id FROM employees; sqlplus hr/hr CREATE USER mjjones IDENTIFIED BY ty3MU9;</pre>

Conventions for Windows Operating Systems

The following table describes conventions for Windows operating systems and provides examples of their use.

Convention	Meaning	Example
Click Start , and then choose the <i>menu item</i>	How to start a program.	To start the Database Configuration Assistant, click Start , and choose Programs . In the Programs menu, choose Oracle - HOME_NAME and then click Configuration and Migration Tools . Choose Database Configuration Assistant .
File and directory names	File and directory names are not case sensitive. The following special characters are not allowed: left angle bracket (<), right angle bracket (>), colon (:), double quotation marks ("), slash (/), pipe (), and dash (-). The special character backslash (\) is treated as an element separator, even when it appears in quotes. If the filename begins with \\, then Windows assumes it uses the Universal Naming Convention.	c:\winnt\\"system32 is the same as C:\WINNT\SYSTEM32
C:\>	Represents the Windows command prompt of the current hard disk drive. The escape character in a command prompt is the caret (^). Your prompt reflects the subdirectory in which you are working. Referred to as the <i>command prompt</i> in this manual.	C:\oracle\oradata>
Special characters	The backslash (\) special character is sometimes required as an escape character for the double quotation mark (") special character at the Windows command prompt. Parentheses and the single quotation mark (') do not require an escape character. Refer to your Windows operating system documentation for more information on escape and special characters.	C:\>exp HR/HR TABLES=employees QUERY=\"WHERE job_id='SA_REP' and salary<8000\"

Convention	Meaning	Example
<i>HOME_NAME</i>	Represents the Oracle home name. The home name can be up to 16 alphanumeric characters. The only special character allowed in the home name is the underscore.	C:\> net start Oracle <i>HOME_NAME</i> TNSListener
<i>ORACLE_HOME</i> and <i>ORACLE_BASE</i>	<p>In releases prior to Oracle8i release 8.1.3, when you installed Oracle components, all subdirectories were located under a top level <i>ORACLE_HOME</i> directory.</p> <p>This release complies with Optimal Flexible Architecture (OFA) guidelines. All subdirectories are not under a top level <i>ORACLE_HOME</i> directory. There is a top level directory called <i>ORACLE_BASE</i> that by default is C:\oracle\product\10.1.0. If you install the latest Oracle release on a computer with no other Oracle software installed, then the default setting for the first Oracle home directory is C:\oracle\product\10.1.0\db_n, where <i>n</i> is the latest Oracle home number. The Oracle home directory is located directly under <i>ORACLE_BASE</i>.</p> <p>All directory path examples in this guide follow OFA conventions.</p> <p>Refer to <i>Oracle Database Installation Guide for Windows</i> for additional information about OFA compliances and for information about installing Oracle products in non-OFA compliant directories.</p>	Change to the <i>ORACLE_BASE\ORACLE_HOME\rdms\admin</i> directory.

Introduction

Oracle Application Server connects to an SAP system through Oracle Application Server Adapter for SAP R/3 (OracleAS Adapter for SAP). OracleAS Adapter for SAP provides connectivity and executes interactions on an SAP system. This chapter discusses the following topics:

- [Adapter Features](#)
- [SAP Concepts](#)
- [Integration with SAP](#)
- [Adapter Architecture](#)
- [BSE Versus OracleAS Adapter J2CA Deployment](#)

Adapter Features

OracleAS Adapter for SAP provides a means to exchange real-time business data between SAP systems and other applications, databases, or external business partner systems. The **adapter** enables external applications to perform inbound and outbound processing with SAP. OracleAS Adapter for SAP can be deployed as a J2EE Connector Architecture (J2CA) version 1.0 resource adapter. This deployment is referred to as OracleAS Adapter J2CA. It can also be deployed as a Web services servlet and is referred to as OracleAS Adapter Business Services Engine (BSE).

OracleAS Adapter for SAP uses XML messages to enable non-SAP applications to communicate and exchange transactions with SAP using services and events. The role of services and events is outlined.

- **Services:** Enable applications to call an SAP business object or business operation.
- **Events:** Enable applications to access SAP data only when an SAP business event occurs.

To support event functionality, the following two features are implemented:

- **Port:** A **port** associates a particular business object exposed by an adapter with a particular disposition. A disposition defines the protocol and location of the event data. The port defines the end point of the event consumption.

The port is the Oracle adapter component that pushes the event received from the enterprise information system (EIS) to the adapter client. The port supported in this release is Remote Method Invocation (RMI).

Note: You do not need to create or configure ports for use with BPEL Process Manager.

- Channel: A **channel** represents configured connections to particular instances of back-end or other types of systems. A channel binds one or more event ports to a particular **listener** managed by an adapter.

The channel is the adapter component that receives events in real time from the EIS application. The channel component can be a File reader, an HTTP listener, a TCP/IP listener, or an FTP listener.

A channel is always EIS specific. The adapter supports multiple channels for a particular EIS. This enables the user to choose the optimal channel component based on deployment requirements. In the case of this adapter, the channel is an RFC server.

OracleAS Adapter for SAP provides:

- Support for bidirectional message interactions.
- OracleAS Adapter Application Explorer (Application Explorer), a GUI tool which uses SAP object repository metadata to build XML schemas and Web services to handle adapter requests or event data.
- Support for Remote Function Calls (RFC), Business Application Programming Interfaces (BAPI), and Intermediate Documents (IDoc) interfaces to SAP.
- XML schemas for the J2CA 1.0 resource adapter.
- Web services for BSE.

See Also: *Oracle Application Server Adapter Concepts*

SAP Certification

SAP has certified OracleAS Adapter for SAP for use with all versions of SAP, including mySAP.com solutions.

OracleAS Adapter for SAP provides state-of-the-art middleware solutions for SAP Basis and SAP Web application server-based systems. This adapter has achieved the following three interface certifications that promote cost-effective and low-risk solutions.

- **CA-ALE (Certified Adapter - Application Link Enabling) certification.** Enhances electronic data interchange (EDI) subsystem interface with SAP Basis and SAP Web Application Server. Using direct program-to-program remote communication and transformation from non-SAP systems to SAP solution-based systems, OracleAS Adapter for SAP expedites the conversion, import, and export of critical intermediate documents (IDocs).
- **CA-AMS (Andrew Message System) certification.** Rapidly bridges SAP Basis and SAP Web Application Server data exchange with other applications through pure message delivery. As an ALE (Application Link Enabling) Message Handler, the adapter sends IDoc messages without a requirement for conversion from one or more SAP solution-based systems.
- **CA-XML (Extensible Markup Language) certification.** Eases the communication between external middleware with SAP Basis and SAP Web Application Server over the Internet using XML, HTTP, or HTTPS. The adapter immediately transfers SAP solution specifications into XML for straight transfer into application subsystem repositories. The CA-XML-certified adapter directly receives and converts messages to be pulled or pushed into XML formats to or from SAP solution-based systems over the Internet.

Supported Platforms

The following SAP platforms are supported by OracleAS Adapter for SAP:

- SAP Web Application Server Version 6.2 and higher
- SAP R/3 4.0 and higher
- SAP Enterprise R/3 4.7
- All or portions of: MySAP.com technology solutions (SAP BW, SAP APO, SAP CRM, SAP SRM, SAP EBP, SAP SEM, SAP WP, SAP KW)

Note: Release versions may vary by product component. In addition, SAP functions may vary by SAP product version and support package.

OracleAS Adapter for SAP is supported on the following operating systems:

- Windows 2000/2003/XP
- Solaris Version 2.8, 2.9, and higher
- Linux x86 Redhat Advanced Server Version 2.1 and higher, Suse Version 8.1 and higher, United Linux Version 1.0 and higher
- IBM AIX Version 5.1 and higher
- HP-UX Version 11i and higher
- HP Tru64 Version 5.1a and higher

SAP Concepts

OracleAS Adapter for SAP is designed to provide standard access to SAP business objects such as Remote Function Call (RFC) modules, BAPIs (Business Application Programming Interfaces), and IDocs (Intermediate Documents) that are used to support existing business processes. The business objects and methods are available to the adapter as requests of SAP and to the event adapter when SAP initiates its remote requests. These objects work in the following ways:

- **Business Application Programming Interfaces (BAPI)** are interfaces within the business framework that link SAP components to one another or to third-party components. BAPIs are called synchronously and return information.
- **Remote Function Call (RFC) Modules** are SAP application interfaces that enable clients to utilize SAP technologies and receive responses.

Note: Depending on the release or service pack installed, certain RFCs, for example, `RFC_CUSTOMER_GET`, may not exist in your particular SAP system. Therefore, the examples included in this documentation may not be relevant to your system. If this is the case, you should use the examples as a general reference for adapter functionality and choose an RFC that exists within your SAP application environment.

As described in SAP Release Note 109533, SAP Function Modules (RFCs) can be delivered with different release statuses. SAP supports only RFCs that are awarded with the Released for Customer status. There is no claim to the release independencies of the interfaces and the continued existence/functionality of the modules. For more information on the status of a specific function module, consult your SAP Service Marketplace.

- **Intermediate Documents (IDocs)** are the "logical messages" that correspond to different business processes. They enable different application systems to be linked by a message-based interface. The IDoc type indicates the SAP format to use to transfer the data for a business transaction. An IDoc is a real business process in the form of an IDoc type that can transfer several message types. An IDoc type is described by the following components:
 - **Control records.** A control record contains data that identifies the sender, the receiver, and the IDoc structure. An IDoc contains one control record.
 - **Data records.** A data record consists of a fixed administration part and a data part (segment). The number and format of the segments can be different for each IDoc type.
 - **Status records.** A status record describes the processing stages through which an IDoc passes.

The following scenario is an example of IDoc functionality and its components:

Purchase order number 4711 was sent to a vendor as IDoc number 0815. IDoc number 0815 is formatted in IDoc type `ORDERS01` and has the status records "created" and "sent." The purchase order corresponds to the logical message `ORDERS`.

Integration with SAP

You can use OracleAS Adapter for SAP to initiate an SAP business process, such as add/update account, or you can use the adapter as part of an integration effort to connect SAP and non-SAP systems.

BAPI and RFC are called synchronously by the adapter and always return data (either technical error information or a well-formed response document). IDocs are processed asynchronously.

The adapter is bidirectional and can process an event in SAP by receiving RFC and IDocs directly from SAP. The SAP system can be configured to send an IDoc or RFC out to a logical system when a certain event occurs, in this case, to the adapter. The output sent by SAP can be in any of the following forms:

- An RFC request, for example, `RFC_CUSTOMER_GET`
- A BAPI request, for example, `BAPI_COMPANYCODE_GETLIST`

- An IDoc

For request processing, OracleAS Adapter for SAP can send requests to SAP using the BAPI, RFC, or IDoc interfaces.

OracleAS Adapter for SAP integrates SAP IDocs, RFC, and BAPI with mission-critical SAP system applications and other enterprise applications. The benefits of the adapter include:

- Elimination of the requirement for custom coding.
- Consistent data representation—a standard XML representation of event data and request/response documents for SAP. The developer is freed from the specific details of the SAP interface (BAPI, RFC, IDoc,) and the specific configuration details of the target SAP system.
- Adherence to SAP ABAP serialization rules and SAP Interface Repository standards published by SAP AG.

Adapter Architecture

OracleAS Adapter for SAP works in conjunction with the following components:

- Application Explorer
- BSE
- J2CA

Application Explorer (used to configure SAP connections and create Web services and events) can be configured to work in a Web services environment in conjunction with BSE or J2CA. When working in a J2CA environment, the connector uses the Common Client Interface (CCI) to provide integration services using adapters instead of Web services.

Oracle Application Server Adapter Business Services Engine (BSE) Architecture

[Figure 1–1](#) shows the generic architecture for BSE for packaged applications.

Application Explorer works in conjunction with BSE, as deployed to the OC4J (Oracle Containers for J2EE) container of the Oracle Application Server.

Application Explorer, a design-time tool deployed along with BSE, is used to configure adapter connections, browse EIS objects, configure services, and configure listeners to listen for EIS events. Metadata created while you perform these operations are stored in the repository by BSE.

BSE uses SOAP as a protocol for consuming requests from clients, interacting with the EIS, and sending responses from the EIS back to clients.

BSE supports both a file-based and an Oracle database repository. The BSE repository stores the EIS connection information and the WSDL for adapter services. A single instance of BSE can connect to multiple EIS applications.

Note: Do not use a file repository for BSE in production environments.

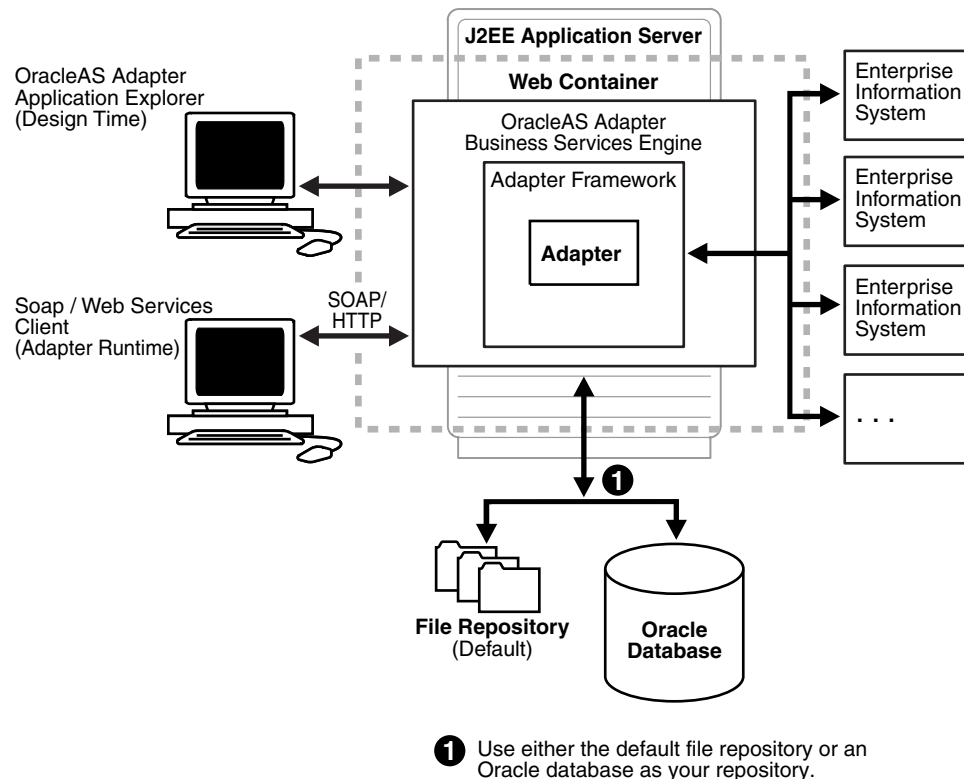

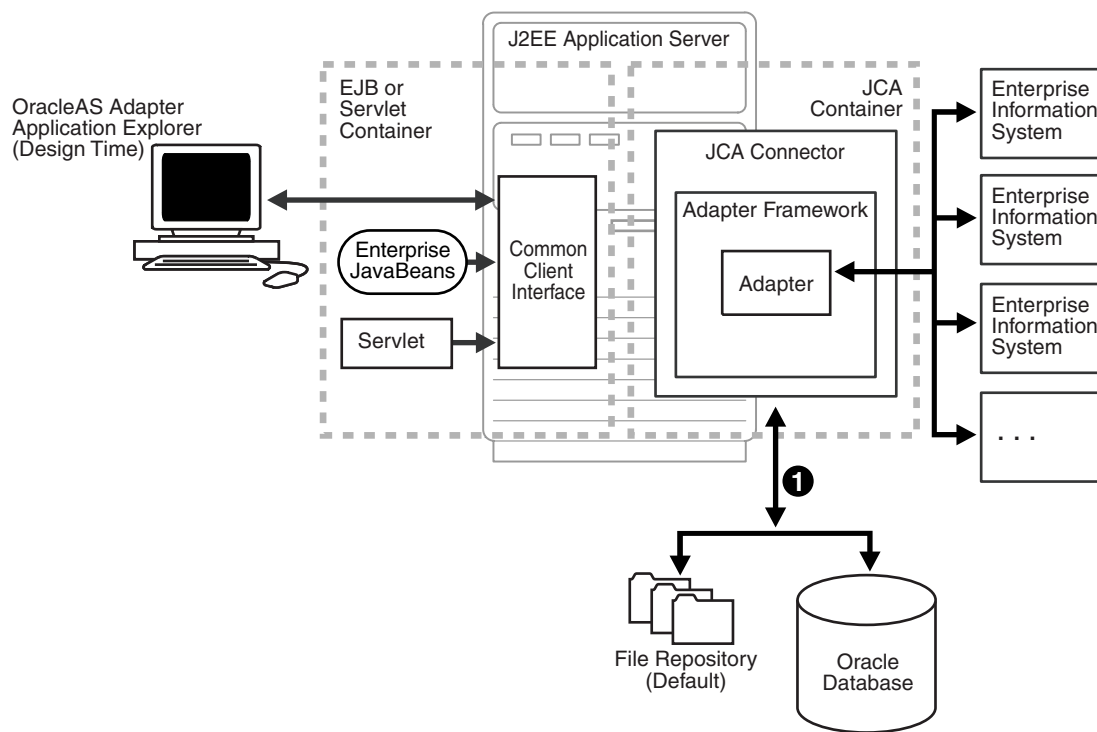

Figure 1–1 Oracle Application Server Adapter Business Services (BSE) Architecture**Oracle Application Server Adapter Generic J2CA Architecture**

Figure 1–2 shows the generic architecture for OracleAS Adapter J2CA for packaged applications. This is a pure J2CA 1.0 Resource Adapter deployed in managed mode in the OC4J container of the Oracle Application Server. It is a universal adapter. One adapter can connect to many EIS applications.

The OracleAS Adapter J2CA repository contains the list of EIS connection names and the associated connection parameters. The repository can be a file system or an Oracle database. It is deployed as a RAR file and has an associated deployment descriptor called `ra.xml`. You can create multiple connector factories by editing the OC4J deployment descriptor `oc4j-ra.xml`. See [Chapter 3, "OC4J Deployment and Integration"](#) for more information on OC4J deployment.

Figure 1–2 Oracle Application Server Adapter Generic J2CA Architecture

1 Use either the default file repository or an Oracle database as your repository.

- *Oracle Application Server Adapter Concepts*
- *Oracle Application Server Adapters Installation Guide*

BSE Versus OracleAS Adapter J2CA Deployment

If using OracleAS Adapter for SAP with BPEL Process Manager, please note that:

- Only OracleAS Adapter J2CA deployment supports inbound integration (event notification) with BPEL Process Manager.
- Both OracleAS Adapter J2CA and BSE deployments support outbound integration (request-response service) with BPEL Process Manager.

The following four factors explain the differences between deploying BSE and OracleAS Adapter J2CA. Understanding the factors can help in selecting a deployment option.

1. BSE is the preferred deployment option because it:
 - Can be deployed in a separate instance of Oracle Application Server.
 - Provides better distribution of load.
 - Provides better isolation from any errors from third party libraries.
 - Provides better capability to isolate issues for debugging purposes.

- Conforms more closely to Service Oriented Architecture (SOA) model for building applications.
- 2. OracleAS Adapter J2CA provides slightly better performance
OracleAS Adapter J2CA does provide slightly better performance than BSE; however, the difference decreases as the transaction rate increases.
- 3. OracleAS Adapter J2CA and the BSE option both provide identity propagation at runtime
The BSE option provides the capability to pass identity using the SOAP header. For OracleAS Adapter J2CA, user name and password can be passed using the connection spec of the CCI.
- 4. Transactions

Configuring OracleAS Adapter for SAP

This chapter describes how to use OracleAS Adapter Application Explorer (Application Explorer) to define a target to connect to an SAP system, view system objects, and create XML schemas and Web services. This chapter also explains how to configure an event adapter.

This chapter discusses the following topics:

- [Starting Application Explorer](#)
- [Configuring Settings for BSE or J2CA](#)
- [Creating a Repository Configuration](#)
- [Establishing a Connection \(Target\) for SAP](#)
- [Viewing Application System Objects](#)
- [Creating an XML Schema](#)
- [Creating and Testing a Web Service \(BSE Configurations Only\)](#)
- [Configuring an Event Adapter](#)

Starting Application Explorer

To start Application Explorer:

1. Ensure the server is started where Application Explorer is deployed.
2. On Windows, select **Start > Programs > OracleAS_home Adapters > Application Explorer**.

On Windows, `iaexplorer.bat` is found under `OracleAS_home\adapters\application\tools`, where `OracleAS_home` is the directory where Oracle Application Server is installed.

On UNIX, load the `iwae` script, `iwae.sh`, found under `OracleAS_home/adapters/application/tools`, where `OracleAS_home` is the directory where Oracle Application Server is installed.

Application Explorer starts. You are ready to define new targets to your SAP system.

Configuring Settings for BSE or J2CA

You need not configure BSE for a file-based repository because it is configured during the Oracle installation. You also need not configure the OracleAS Adapter J2CA because the `ra.xml` file is configured automatically during installation.

Configuring BSE

After BSE is deployed to Oracle Application Server, you can configure it through the BSE configuration page. This configuration is required only when using a database repository with BSE.

Note: Do not use a file repository for BSE in production environments.

To configure BSE:

1. Display the following page in your browser:

`http://hostname:port/ibse`

Where `hostname` is the machine where BSE is installed and `port` is the HTTP port for Oracle Application Server.

For example,

`http://localhost:7777/ibse`

Note: If you are accessing this page for the first time, it may take longer to load.

2. When prompted, log on.

When first installed, the user ID and password are:

- User name: iway
- Password: iway

The BSE configuration page is displayed.

Property Name	Property Value
System	
Language	English
Adapter Lib Directory	../adapters/application/lib
Encoding	UTF-8
Debug Level	NONE
Number of Async. Processors	0
Security	
Admin User	iway
Admin Password	••••
Policy	<input type="checkbox"/>
Repository	
Repository Type	File System
Repository Url	file://M:\oracle\oraAS10gRC2\2ee\hor

3. Ensure that the Adapter Lib Directory parameter specifies the path to the lib directory, for example:

```
OracleAS_home\adapters\application\lib
```

Where OracleAS_home is the directory where Oracle Application Server is installed.

After you specify the path, adapters in the lib directory are available to BSE.

4. For security purposes, enter a new password in the **Admin Password** field.

Note: The Repository URL field specifies where the file system repository is located. To use a database repository, you must enter the repository connection information. For the initial verification, use a file system repository. See "[Configuring an Oracle Repository](#)" on page 2-6 for information on switching to a database repository.

5. Click **Save**.

Configuring BSE System Settings

To configure BSE system settings:

1. Display the **BSE configuration** page in a browser:

```
http://hostname:port/ibse/IBSEConfig
```

Where *hostname* is the machine where BSE is installed and *port* is the port number on which BSE is listening.

Note: The server to which BSE is deployed must be running.

The BSE settings pane is displayed, as shown in the following figure.

Property Name	Property Value
System	
Language	English ▾
Adapter Lib Directory	../adapters/application/lib
Encoding	UTF-8 ▾
Debug Level	NONE ▾
Number of Async. Processors	0 ▾

2. Configure the system settings.

The following table lists the parameters with descriptions of the information to provide.

Parameter	Description
Language	Specify the required language.
Adapter Lib Directory	Enter the full path to the directory where the adapter jar files reside.
Encoding	Specify the default encoding from one of the following options: <ul style="list-style-type: none"> ■ UTF-8 ■ EBCDIC-CP-US ■ ISO-8859-1 ■ Shift JIS ■ UNICODE
Debug Level	Specify the debug level from one of the following options: <ul style="list-style-type: none"> ■ None ■ Fatal ■ Error ■ Warning ■ Info ■ Debug
Number of Async. Processors	Select the number of asynchronous processors.

The following image shows the Security pane.

Security

Admin User

Admin Password

Policy ☐

3. Configure the security settings.

The following table lists the parameters with descriptions of the information to provide.

Parameter	Description
Admin User	Provide a BSE administrator ID.
Admin Password	Enter the password associated with the BSE administrator ID.
Policy	Select the check box to enable policy security.

The following image shows all fields and check boxes for the Repository pane.

Repository

Repository Type

Repository Url

Repository Driver

Repository User

Repository Password

Repository Pooling ☐

Save

4. Configure the repository settings.

BSE requires a repository to store transactions and metadata required for the delivery of Web services.

See ["Configuring a File System Repository"](#) on page 2-6 and ["Configuring an Oracle Repository"](#) on page 2-6 for more information.

The following table lists the parameters with descriptions of the information to provide.

Parameter	Description
Repository Type	Select one of the following repositories from the list: <ul style="list-style-type: none"> ■ Oracle ■ File (Do not use for BSE in production environments.)

Parameter	Description
Repository URL	Enter the URL to use when opening a connection to the database.
Repository Driver	Provide the driver class to use when opening a connection to the database (optional).
Repository User	Enter the user ID to use when opening a connection to the database.
Repository Password	Enter the password associated with the user ID.
Repository Pooling	Select the check box to enable pooling.

5. Click **Save**.

Configuring a File System Repository

If you do not have access to a database for the repository, you can store repository information in an XML file on your local machine. However, a file system repository is less secure and efficient than a database repository. When BSE is first installed, it is automatically configured to use a file system repository.

Note: Do not use a file repository for BSE in production environments.

The default location for the repository on Windows is:

```
OracleAS_home\j2ee\OC4J_CONTAINER\applications\ws-app-adapter
\ibse\ibserrepo.xml
```

On other platforms, use the corresponding location.

If you are using a file system repository, you are not required to configure any additional BSE components.

Configuring an Oracle Repository

To configure an Oracle repository:

1. Contact your database administrator to obtain an Oracle user ID and password to create the BSE repository.

This user ID should have rights to create and modify tables as well as the ability to create and execute stored procedures.

2. Open a command prompt and navigate to the setup directory. The default directory location on Windows is:

```
OracleAS_home\adapters\application/etc
```

For other platforms, see the corresponding location.

This directory contains SQL to create the repository tables in the following file:

```
iwse.ora
```

Note: If Oracle is not on the same machine as the Oracle Application Server, copy the iwse.ora file to the Oracle machine. Then, from a command prompt on the Oracle machine, navigate to the directory containing the iwse.ora file.

3. Enter the following command:

```
sqlplus userid/password @database @ iwse.ora
```

Configuring J2CA

During the J2CA deployment of OracleAS Adapter for SAP, OC4J generates a deployment descriptor called `oc4j-ra.xml`. This descriptor provides OC4J-specific deployment information for resource adapters. See [Chapter 3, "OC4J Deployment and Integration"](#) for more information on J2CA deployment and configuration.

No configuration changes are necessary if you are using the default file based repository with J2CA deployment.

Configuring a Database Repository for J2CA

To configure a database repository for J2CA:

1. Execute the `iwse.ora` SQL statement on the machine where the database is installed.

2. Copy the `jcatransport.properties` file to the following directory:

```
OracleAS_home\adapters\application\config\jca_sample
```

3. Uncomment the following fields and enter details for them in the `jcatransport.properties` file. For example:

```
iwafjca.repo.url=jdbc:oracle:thin:@90.0.0.51:1521:orcl
iwafjca.repo.user=scott
iwafjca.repo.password=scott1
```

4. Alter the JDBC driver path in Application Explorer's `lcp`. For example:

```
lcp=..\lib\orabpel-adapters.jar;C:\jdev\jdbc\lib\classes12.jar;C:\jdev\jdbc\lib\
nls_charset12.jar;%lcp%
to
lcp=..\lib\orabpel-adapters.jar;..\..\..\jdbc\lib\classes12.jar;..\..\..\jdbc\l
ib\nls_charset12.jar;%lcp%
```

Creating a Repository Configuration

Before you use Application Explorer with OracleAS Adapter for SAP, you must create a repository configuration. You can create two kinds of repository configurations, Web services and J2CA, depending on the container to which the adapter is deployed.

During design time, the repository is used to store metadata created when using Application Explorer to configure adapter connections, browse EIS objects, configure services, and configure listeners to listen for EIS events. The information in the repository is also referenced at runtime.

A default J2CA repository is created for the default `ManagedConnectionFactory`. The name of this configuration is `jca_sample`.

Web services and BSE refer to the same type of deployment. See ["Adapter Features"](#) on page 1-1 for more information.

Creating a Configuration for BSE

To create a configuration for BSE using Application Explorer, you must first define a new configuration.

Defining a New Configuration for BSE

To define a new configuration for BSE:

1. Right-click **Configurations** and select **New**.
The New Configuration dialog box is displayed.
2. Enter a name for the new configuration, for example, SampleConfig, and click **OK**.

3. From the **Service Provider** list, select **iBSE**.
4. In the **BSE URL** field, accept the default URL or replace it with a different URL with the following format:

`http://hostname:port/ibse/IBSEServlet`

Where `hostname` is the machine where your application server resides and `port` is the port number where the application server is listening.

5. Click **OK**.

A node representing the new configuration appears beneath the root **Configurations** node.

The Web service repository configuration file is stored in `OracleAS_home\j2ee\home\applications\ws-app-adapter\ibse`.

Creating a Configuration for J2CA

To create a configuration for OracleAS Adapter J2CA using Application Explorer, you must first define a new configuration.

Defining a New Configuration for J2CA

To define a new configuration for J2CA:

1. Right-click **Configurations** and select **New**.
2. In the dialog box, enter a name for the new configuration, for example, SampleConfig, and click **OK**.

The following dialog box is displayed.

3. From the **Service Provider** list, select **JCA**.
4. In the **Home** field, enter a path to your J2CA configuration directory where the repository, schemas, and other information is stored, for example:

`OracleAS_home\adapters\application`

5. Click **OK**.

A node representing the new configuration appears beneath the root Configurations node.

The OracleAS Adapter J2CA configuration file is stored in `OracleAS_home\adapters\application\config\configuration_name`

Where `OracleAS_home` is the directory where Oracle Application Server is installed and `configuration_name` is the name of the configuration you created; for example, `SampleConfig`.

Connecting to a New Configuration

To connect to a new configuration:

1. Right-click the configuration to which you want to connect, for example, **SampleConfig**.
2. Select **Connect**.

Nodes appear for Adapters, Events, and Business Services (also known as Web services).

- Use the **Adapters** folder to create inbound interaction with SAP. For example, you use the SAP node in the Adapters folder to configure a service that updates SAP.
- Use the **Events** folder to configure listeners that listen for events in SAP.

- Use the **Business Services** folder (available for BSE configurations only) to test Web services created in the Adapters folder. You can also control security settings for the Web services by using the security features of the Business Services folder.

You are now ready to define new targets to SAP.

Establishing a Connection (Target) for SAP

Defining the application includes adding a target for OracleAS Adapter for SAP. Setting up the target in Application Explorer requires information that is specific to the target.

To browse the available business functions, you must first define a target to SAP. After you define the target, it is automatically saved. You must connect to the SAP system every time you start Application Explorer or after you disconnect.

When you launch Application Explorer, the left pane displays (as nodes) the application systems supported by Application Explorer, based on the adapters that are installed.

Connecting to SAP

To connect to SAP for the first time, you must define a new target. OracleAS Adapter for SAP supports SAP standard security and the additional protocol of SNC. Once connected to the SAP application server, application security is managed by user ID, roles and profiles. For more information on SAP application security, see the appropriate SAP documentation.

Defining a Target for SAP

To define a target:

1. In the left pane, expand the **Adapters** node.

A list of all adapters is displayed.

The applications systems supported by Application Explorer appear as nodes based on the adapters that are installed.

2. Right-click the **SAP** node and select **Add Target**.

The Add Target dialog box is displayed. Provide the following information:

- a. In the **Name** field, enter a descriptive name, for example, **SAPTarget**.

- b. In the **Description** field, enter a description for the target (optional).
- c. From the **Target Type** list, select the type of target you are connecting to. The supported target types include **Message Server** or **Application Server** (default).

Note: For load balancing purposes, application servers from one SAP system are usually configured in logon groups, where each group serves a particular kind of user. The application servers in each group are assigned to users by a least-heavily-loaded strategy. This load balancing is done by message servers. Each SAP system has exactly one message server, which can be reached through TCP on a specific message server port.

3. Click **OK**.

The Application Server dialog box appears.

The following tabs are available:

- System (Required)
- User (Required)
- Advanced
- Security

4. For the **System** tab, enter the appropriate information for your SAP target based on the information in the following table.

Table 2–1 System Tab Parameters

Target Parameter	Description
Application Server	The host name or IP address for the computer that is hosting the SAP application.
System Number	The system number defined to SAP for client communications.
EDI Version	The Electronic Data Interchange (EDI) document version that you are using with the adapter. Version 3 is the default value.

5. For the **User** tab, enter the appropriate information for your SAP target based on the information in the following table.

Table 2–2 User Tab Parameters

Target Parameter	Description
Client	The client number defined for the SAP application for client communications.
User	A valid user ID for the SAP application.
Password	A valid password for the SAP application.
Language	A language key. EN (English) is the default.
Code page	A character code page value.
SAP Trace	Select this option to enable traces.

6. For the **Advanced** tab (optional), enter the appropriate information for your SAP target based on the information in the following table.

Table 2–3 Advanced Tab Parameters

Target Parameter	Description
Connection pool size	Enter the number of connections you want to make available to SAP.
Connection pool name	Enter the name of your SAP connection pool.
BAPI Exception Handling	From the list in the event of a BAPI exception, you can select Creates Error Document or Throws Exception . To receive more detailed error messages, select Creates Error Document .
Commit with wait	This option is disabled by default.

7. For the **Security** tab (optional), enter the appropriate information for your SAP target based on the information in the following table.

Table 2–4 Security Tab Parameters

Target Parameter	Description
Logon ticket (SSO2)	If you are using a Secure Network Communications (SNC) adapter with SAP, enter the name of the SSO2 logon ticket you are using.
Logon ticket (X.509)	If you are using an SNC adapter with SAP, enter the name of the X.509 logon ticket you are using.
SNC mode	By default, SNC is disabled. To enable SNC, select 1 from the list.
SNC partner	Enter the name of the RFC server or message server (load balancing) that provides the SNC services.
SNC level	From the list select the version of the SNC library.
SNC name	Enter the name of the SNC library you are using.
SNC library path	Enter the path to the SNC library.

Note: SNC provides protection for the communication links between the distributed components of an R/3 System. Using SNC, SAP R/3 can support products that adhere to the GSS-API Version 2 standard. SNC supports application level (end-to-end security), Smartcard authentication, and single sign-on.

8. When you have provided all the required information for your target, click **Finish**.

After the extraction finishes, the new target, SAPTarget, appears under the SAP adapter node.

See ["Creating an XML Schema"](#) on page 2-14 for information on how to create schemas for the adapter.

Connecting to a Defined SAP Target

To connect to a target:

1. Expand the **Adapters** node.
2. Expand the **SAP** node.
3. Under the **SAP** node, click the target name, for example, SAPTarget.
The Connection dialog box displays the values you entered for connection parameters.
4. Verify your connection parameters.
5. Provide the correct password.
6. Right-click the target name and select **Connect**.

The x icon disappears, indicating that the node is connected.

Managing a Connection to SAP

To manage SAP connections, you can:

- Disconnect from a connection that is not currently in use.
Although you can maintain multiple open connections to different transaction processing systems, it is recommended to disconnect from connections not in use.
- Edit a target.
- Delete a connection that is no longer required.

Disconnecting from a Connection to SAP

To disconnect a target:

1. Expand the **Service Adapters** node.
2. Expand the **SAP** node.
3. Right-click the target to which you are connected, for example, SAPTarget, and select **Disconnect**.

Disconnecting from the SAP target drops the connection with SAP, but the node remains.

The x icon appears, indicating that the node is disconnected.

Editing a Target

To edit a target:

1. In the left pane, ensure the target you wish to edit is disconnected.
2. Right-click the target and select **Edit**.
The Edit pane is displayed on the right.
3. Modify the target information.
4. Click **OK**.

Deleting a Connection to SAP

To delete a connection:

1. Expand the **Service Adapters** node.
2. Expand the **SAP** node.
3. Right-click the target to which you are connected, for example, SAPTarget, and select **Delete**.

The node disappears from the list of available connections.

Viewing Application System Objects

Note: Depending on the release or service pack installed, certain RFCs, for example, RFC_CUSTOMER_GET, may not exist in your particular SAP system. Therefore, the examples included in this documentation may not be relevant to your system. If this is the case, you should use the examples as a general reference for adapter functionality and choose an RFC that exists within your SAP application environment.

As described in SAP Release Note 109533, SAP Function Modules (RFCs) can be delivered with different release statuses. SAP supports only RFCs that are awarded with the Released for Customer status. There is no claim to the release independencies of the interfaces and the continued existence/functionality of the modules. For more information on the status of a specific function module, consult your SAP Service Marketplace.

See the *SAP User's Guide* for more information.

Creating an XML Schema

After you explore the SAP business function library and select an object, you can use Application Explorer to create the XML request schema and the XML response schema for that function.

Creating a Request and a Response Schema

The following procedure explains how to create request and response schemas for an SAP business function. Application Explorer enables you to create XML schemas for this function.

1. Connect to an SAP target as described in ["Connecting to a Defined SAP Target"](#) on page 2-13.
2. Expand the **Business Object Repository** node.
3. Click the icon to the left of the **Financial Accounting** group.
4. Scroll down and click the icon to the left of the **Company** business object.
5. Scroll down and select the BAPI named BAPI_COMPANY_GETLIST.

The following screen appears on the right.

6. To view the XML for each schema type, click the appropriate tab.

Generating Web Service Definition Language (WSDL) (J2CA Configurations Only)

The Web Service Definition Language (WSDL) description of a service enables you to make the service available to other services within a host server. You use Application Explorer to create both request-response (outbound) and event notification (inbound) J2CA services of the adapter.

Note: The **Create Inbound JCA Service (Event)** option is only available when the selected node supports events.

To generate a WSDL file for request-response service:

1. After you create a schema, right-click the respective object.

The following menu is displayed:

2. Select **Create Outbound JCA Service (Request/Response)**.

The Export WSDL dialog box is displayed.

3. Accept the default name and location for the file.

The **.wsdl** file extension is added automatically. By default, the names of WSDL files generated for request-response services end with **_invoke**, while those generated for event notification end with **_receive**.

Note: You can organize your WSDL files in subfolders, creating your own WSDL hierarchy structure. Create the folders under *OracleAS_home\adapters\application\wsdls*. The WSIL browser in JDeveloper will display the full tree structure of your WSDL hierarchy.

4. Click **OK**.

The WSDL file is saved in the specified location.

Creating and Testing a Web Service (BSE Configurations Only)

You can generate a Web service (also known as a **business service**). You can explore the business function repository and generate Web services for the SAP functions you want to use with the adapter. The following procedure uses the SAP BAPI method called `BAPI_MATERIAL_GETLIST` as an example and returns a list of materials from SAP.

Note: In a J2EE Connector Architecture (J2CA) implementation of the adapter, Web services are not available. When the adapter is deployed to use the OracleAS Adapter J2CA, the Common Client Interface provides integration services using the adapter.

Creating a Web Service

To create a Web service for an SAP business function:

1. Expand the **SAP** node and then expand the **Business Object Repository** node.
2. Select the `BAPI_MATERIAL_GETLIST` method from the **Business Object Repository**.
3. Right-click the node from which you want to create a business service and select **Create Web Service**.

The Create Web Service dialog box is displayed.

You can add the business function as a method for a new Web service or as a method for an existing one. Follow the steps:

- a. From the **Existing Service Names** list, select either **<new service>** or an existing service.
 - b. Specify a service name if you are creating a new service. This name identifies the Web service in the list of services under the **Business Services** node.
 - c. Enter a description for the service (optional).
 - d. Select one of the available licenses.
4. Click **Next**.

The License and Method dialog box is displayed. Provide the following information:

- a. In the **License** field, select one or more license codes to assign to the Web service. To select more than one, hold down the **Ctrl** key and click the licenses.
 - b. In the **Method Name** field, enter a descriptive name for the method.
 - c. In the **Description** field, enter a brief description of the method.
5. Click **OK**.

Application Explorer switches the view to the **Business Services** node, and the new Web service appears in the left pane.

Testing a Web Service

After a Web service is created, you can test it to ensure it functions properly. A test tool is provided for testing the Web service.

To test a Web service:

1. If you are not on the Business Services node of Application Explorer, click the node to access Web services.
2. If it is not expanded, expand the list of Web services under **Business Services**.
3. Expand the **Services** node.
4. Select the name of the business service you want to test.
The business service name appears as a link in the right pane.
5. In the right pane, click the named business services link.
The test option appears in the right pane.
If you are testing a Web service that requires XML input, an input field appears.
6. Enter the appropriate input.
7. Click **Invoke**.

Application Explorer displays the results.

Identity Propagation

If you test or execute a Web service using a third party XML editor, for example XMLSPY, the Username and Password values that you specify in the SOAP header must be valid and are used to connect to SAP. The user name and password values that you provided for SAP during target creation using Application Explorer are overwritten for this Web service request. The following is a sample SOAP header that is included in the WSDL file for a Web service:

```
<SOAP-ENV:Header>
  <m:ibsinfo xmlns:m="urn:schemas-iwaysoftware-com:iwse">
    <m:service>String</m:service>
    <m:method>String</m:method>
    <m:license>String</m:license>
    <m:disposition>String</m:disposition>
    <m:Username>String</m:Username>
    <m>Password>String</m>Password>
    <m:language>String</m:language>
  </m:ibsinfo>
</SOAP-ENV:Header>
```

You can remove the `<m:disposition>` and `<m:language>` tags from the SOAP header, since they are not required.

Configuring an Event Adapter

Events are generated as a result of activity in a database or in an application system. You can use events to trigger an action in your application. For example, an update to a database can reflect an update to customer information. If your application must perform when this happens, your application is a consumer of this event.

After you create a connection to your application system, you can add events using Application Explorer. To create an event, you must create a port and a channel.

Note: If using a J2CA configuration, you must create a new channel for every event and select this channel when creating an inbound service. Additionally, you do not create or configure ports for use with BPEL Process Manager.

- Port

A port associates a particular business object exposed by the adapter with a particular disposition. A disposition is a URL that defines the protocol and location of the event data. The port defines the end point of the event consumption. See ["Creating an Event Port"](#) on page 2-18 for more information.

- Channel

A channel represents configured connections to particular instances of back-end systems. A channel binds one or more event ports to a particular listener managed by the adapter. See ["Creating a Channel"](#) on page 2-21 for more information.

Note: OC4J currently conforms to J2CA 1.0, which does not call for event capabilities. When conforming to J2CA 1.0, only service interactions are supported.

Creating an Event Port

Application Explorer enables you to create event ports from the Adapters node or from the Events node.

Note: Do not create event ports for J2CA configurations. You must create event ports for BSE configurations only.

Creating an Event Port From the Adapters Node

You *cannot* create an event port from the Services node; you must create it from the Adapters node.

To create an event port from the Adapters node:

1. Right-click a node under BAPI, RFC, or IDOC.
2. Select **Create Event Port**. You should not select **Add Port**.

The Create Event Port dialog box is displayed. Provide the following information:

- a. Enter a name for the event port and provide a brief description.
 - b. From the list, select the required disposition, for example, File.
 - c. Enter the disposition URL.
3. Click **OK**.

See ["Creating an Event Port From the Events Node"](#) on page 2-18 for information on configuring port dispositions.

Creating an Event Port From the Events Node

The following procedures describe how to create an event port from the Events node for various dispositions using Application Explorer. You can switch between a BSE

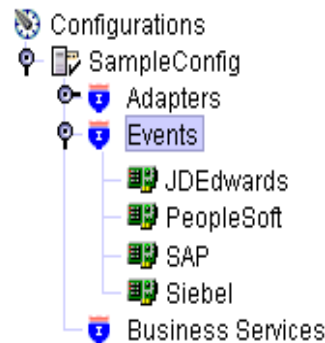

and a J2CA deployment by choosing one or the other from the menu in the upper right of Application Explorer.

See ["Creating an Event Port From the Adapters Node"](#) on page 2-18 for information on creating an event port directly from the Adapters node.

Creating an Event Port for RMI

To create a specific event port for RMI:

1. Click the **Events** node.

2. Expand the **SAP** node.
3. Right-click the **Ports** node and select **Add Port**.

The Add Port dialog box is displayed. Provide the following information:

- a. Enter a name for the event port and provide a brief description.
- b. From the **Protocol** list, select **RMI**.
- c. In the **URL** field, specify a destination file to which the event data is written using the following format:

```
rmi://host:port;RemoteObject=[APPNAME];errorTo=[pre-defined port name or another disposition url]
```

- d. From the **Disposition** protocol list, select **RMI**.

The following table defines the parameters for the disposition.

Parameter	Description
host	The host name or IP address from which the RMI server accepts RMI requests. If you omit this attribute, the RMI server will accept RMI requests from any host.
port	The port number on which the RMI server listens for RMI requests.
RemoteObject	A home or Enterprise Java Bean (EJB) object.
errorTo	Predefined port name or another disposition URL to which error logs are sent.

4. Click **OK**.

The port appears under the ports node in the left pane. In the right pane, a table appears that summarizes the information associated with the event port you created.

You are ready to associate the event port with a channel. See ["Creating a Channel"](#) on page 2-21 for more information.

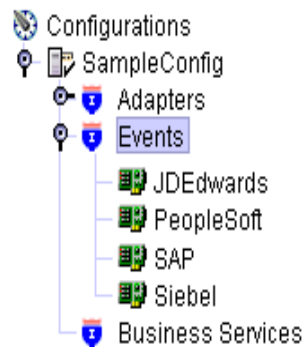

Modifying an Event Port

The following procedures describe how to edit and delete an RMI event port using Application Explorer.

Editing an Event Port

To edit an event port using Application Explorer:

1. Expand the **Events** node.

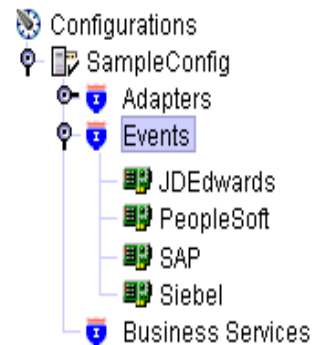

2. Expand the **SAP** node.
3. Right-click the event port you want to edit and select **Edit**.
The Edit Port pane is displayed.
4. Make the required changes and click **OK**.

Deleting an Event Port

To delete an event port using Application Explorer:

1. Expand the **Events** node.

2. Expand the **SAP** node.
3. Right-click the event port you want to delete and select **Delete**.
A confirmation dialog box is displayed.
4. To delete the event port you selected, click **OK**.

The event port disappears from the list in the left pane.

Creating a Channel

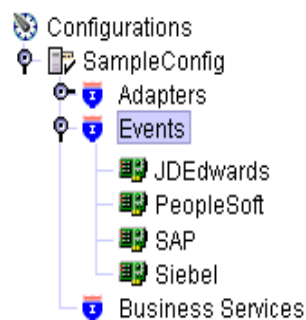

The following procedure describes how to create a channel for your event. All defined event ports must be associated with a channel.

Note: If using a J2CA configuration, you must create a new channel for every event and select this channel when creating an inbound service. Creating a channel is required for both BSE and J2CA configurations.

Creating a Channel

To create a channel:

1. Click the **Events** node.

2. Expand the **SAP** node.

The ports and channels nodes appear in the left pane.

3. Right-click **Channels** and select **Add Channel**.

The Add Channel dialog box is displayed. Provide the following information:

- a. Enter a name for the channel, for example, TEST_CHANNEL.
- b. Enter a brief description.
- c. From the **Protocol** list, select **SAP Channel**.
- d. Select an event port from the list of available ports. To select more than one, hold down the **Ctrl** key and click the ports.
- e. To transfer the ports to the list of selected ports, click >>.

4. Click **Next**.

The Message Server dialog box is displayed.

The following tabs are available:

- System (Required)
- User (Required)
- Advanced

- For the **System** tab, enter the appropriate information for your SAP channel based on the information in the following table.

Table 2–5 System Tab Parameters

Target Parameter	Description
Gateway host	A host name for the SAP Gateway.
Gateway service	A service for the SAP Gateway.
Program ID of the server	An SAP program ID you want to use for this channel.
Message Server	A host name for the message server.
R/3 name	An SAP R/3 name.
Server group	An SAP server group.

- For the **User** tab, enter the appropriate information for your SAP channel based on the information in the following table.

Table 2–6 User Tab Parameters

Target Parameter	Description
Client	The client number defined for the SAP application for client communications.
User	A valid user ID for the SAP application.
Password	A valid password for the SAP application.
Language	A language key. EN (English) is the default.
Code page	A character code page value.

- For the **Advanced** tab (optional), enter the appropriate information for your SAP channel based on the information in the following table.

Table 2–7 Advanced Tab Parameters

Target Parameter	Description
IDOC Format	Select an IDoc type from the list.
User Defined Function Modules	Enter the path to the user-defined function module you created.
SAP trace	Select this check box if you want to enable SAP traces for troubleshooting purposes.
Unicode	Select this check box if you are expecting your response in Unicode format.
Synchronous Processing	Select the type of synchronous processing from the list.

- Click **OK**.

The channel appears under the channels node in the left pane.

An X over the icon indicates that the channel is currently disconnected. You must start the channel to activate your event configuration.

9. Right-click the **channels** node and select **Start**.

The channel you created becomes active.

The X that was over the icon in the left pane disappears.

Note: If you are planning to integrate OracleAS Adapter for SAP with BPEL Process Manager, do not start the channel, as it is managed by the BPEL PM Server. If you start the channel for testing and debugging purposes, stop it before runtime.

10. To stop the channel, right-click the connected **channels** node and select **Stop**.

Editing a Channel

To edit a channel:

1. In the left pane, locate the channel you want to edit.
2. Right-click the channel and select **Edit**.

The Edit channels pane is displayed.

3. Make the required changes to the channel configuration and click **Finish**.

Deleting a Channel

To delete a channel:

1. In the left pane, locate the channel you want to delete.
2. Right-click the channel and select **Delete**.

A confirmation dialog box is displayed.

3. To delete the channel you selected, click **OK**.

The channel disappears from the list in the left pane.

OC4J Deployment and Integration

This chapter describes Oracle Containers for J2EE (OC4J) deployment and integration with OracleAS Adapter for SAP.

This chapter discusses the following topics:

- [Adapter Integration with OC4J](#)
- [Deployment of Adapter](#)
- [Updating Adapter Configuration](#)
- [How to Write a Java Application Client Using the CCI API](#)

See Also:

- *Oracle Application Server Adapter Concepts*
- *Oracle Application Server Containers for J2EE User's Guide*

Adapter Integration with OC4J

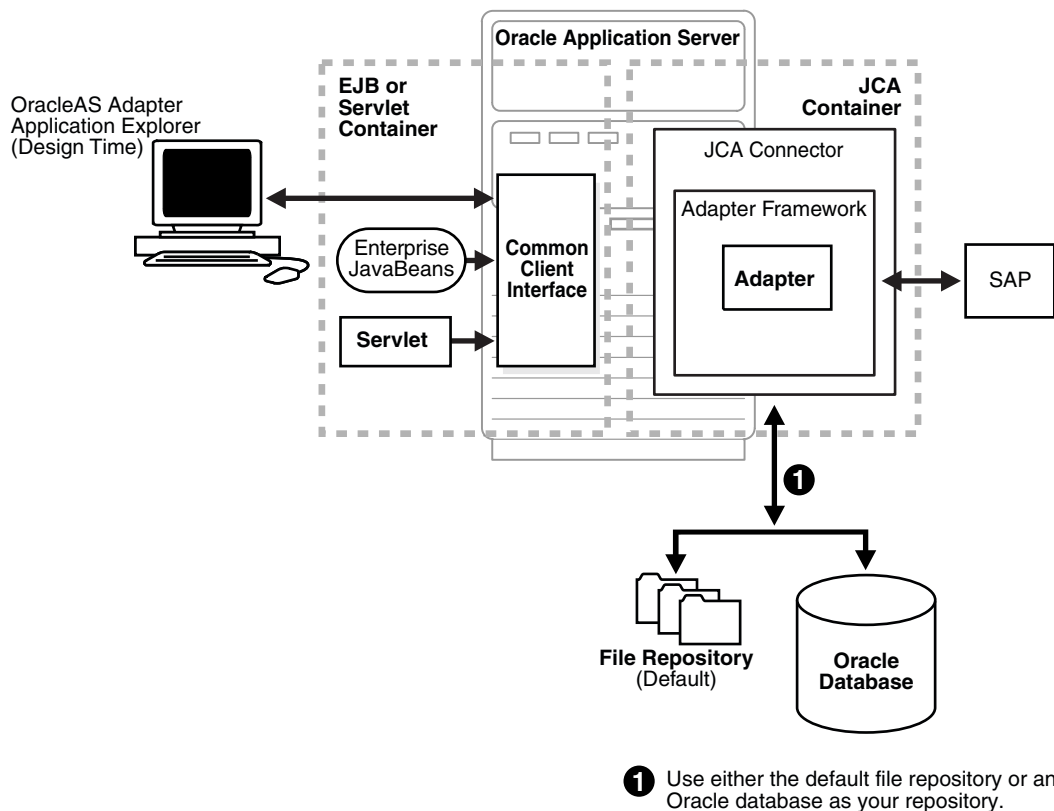

OracleAS Adapter for SAP is deployed within an OC4J container during installation. All client applications run within the OC4J environment. In J2CA deployment, the Common Client Interface (CCI) integrates an OC4J client application with a resource adapter.

See Also:

- "Oracle Application Server Adapters Integration with OC4J" in *Oracle Application Server Adapter Concepts*

Deployment of Adapter

[Figure 3–1](#) shows deployment of the J2CA Connector to the Oracle Application Server. In a runtime service scenario, an Enterprise Java Bean (EJB), servlet, or Java program client makes CCI calls to J2CA resource adapters. The adapters process the calls as requests and send them to the EIS. The EIS response is then sent back to the client.

Figure 3–1 Oracle Application Server J2CA Architecture**See Also:**

- *Oracle Application Server Adapter Concepts*

Updating Adapter Configuration

During the J2CA deployment of OracleAS Adapter for SAP, OC4J generates a deployment descriptor called `oc4j-ra.xml`, located in `OC4J_home\integration\orabpel\system\appserver\oc4j\j2ee\home\application-deployments\default\iwafjca`.

Note: Your installation contains more than one file named `oc4j-ra.xml`. The OC4J deployment descriptor described in this section is located in the directory specified.

Creating a Managed Connector Factory Object

The `oc4j-ra.xml` descriptor provides OC4J-specific deployment information for resource adapters. For example, the default `jca_sample` configuration in Application Explorer is represented in the `oc4j-ra.xml` file as follows:

```
<?xml version="1.0"?>
<!DOCTYPE oc4j-connector-factories PUBLIC "-//Oracle//DTD Oracle Connector >
9.04//EN" "http://xmlns.oracle.com/ias/dtds/oc4j-connector-factories-9_04.dtd"
<oc4j-connector-factories>
  <connector-factory location="eis/OracleJCAAdapter/DefaultConnection"
connector-name="IWAFJCA10">
```

```

<config-property name="IWayHome" value="../../../adapters/application"/>
<config-property name="IWayConfig" value="jca_sample"/>
<config-property name="IWayRepoURL" value="" />
<config-property name="IWayRepoUser" value="" />
<config-property name="IWayRepoPassword" value="" />
<config-property name="logLevel" value="debug" />
</connector-factory>
</oc4j-connector-factories>

```

The parameters defined in the oc4j-ra.xml file are described in the following table:

Parameter Name	Description
IWayHome	The base installation directory for the OracleAS packaged application adapter.
IWayConfig	The adapter configuration name as defined in Application Explorer. For example, OracleAS Adapter for SAP has a preconfigured <code>jca_sample</code> configuration in Application Explorer.
IWayRepoURL	The URL to use when opening a connection to the database. This is necessary only when using an Oracle database as the BSE repository. See "Configuring an Oracle Repository" in Chapter 2, "Configuring OracleAS Adapter for SAP" for more information.
IWayRepoUser	User name to use when connecting to the database. This is necessary only when using an Oracle database as the BSE repository. See "Configuring an Oracle Repository" in Chapter 2, "Configuring OracleAS Adapter for SAP" for more information.
IWayRepoPassword	Password. If provided, it overwrites configuration. This is necessary only when using an Oracle database as the BSE repository. See "Configuring an Oracle Repository" in Chapter 2, "Configuring OracleAS Adapter for SAP" for more information.
loglevel	It overwrites the level set by the ManagedConnectorFactory property.

Creating Multiple Managed Connector Factory Objects

To establish multiple managed connector factory objects, you must edit the `oc4j-ra.xml` file and add more `<connector-factory>` nodes. For example, the default `jca_sample` configuration in Application Explorer is represented in the `oc4j-ra.xml` file as follows:

```

<?xml version="1.0"?>
<!DOCTYPE oc4j-connector-factories PUBLIC "-//Oracle//DTD Oracle Connector
9.04//EN" "http://xmlns.oracle.com/ias/dtds/oc4j-connector-factories-9_04.dtd">
<oc4j-connector-factories>
  <connector-factory location="eis/OracleJCAAdapter/DefaultConnection"
connector-name="IWAFJCA10">
    <config-property name="IWayHome" value="../../../adapters/application"/>
    <config-property name="IWayConfig" value="jca_sample"/>
    <config-property name="IWayRepoURL" value="" />

```

```
<config-property name="IWayRepoUser" value=""/>
<config-property name="IWayRepoPassword" value=""/>
<config-property name="logLevel" value="debug"/>
</connector-factory>
</oc4j-connector-factories>
```

To create multiple managed connector factory objects, you must add new `<connector-factory>` nodes in the file. For example:

```
<?xml version="1.0"?>
<!DOCTYPE oc4j-connector-factories PUBLIC "-//Oracle//DTD Oracle Connector
9.04//EN" "http://xmlns.oracle.com/ias/dtds/oc4j-connector-factories-9_04.dtd">
<oc4j-connector-factories>
  <connector-factory location="eis/OracleJCAAdapter/DefaultConnection1"
connector-name="IWAFJCA10">
    <config-property name="IWayHome" value="../../adapters/application"/>
    <config-property name="IWayConfig" value="jca_sample"/>
    <config-property name="IWayRepoURL" value=""/>
    <config-property name="IWayRepoUser" value=""/>
    <config-property name="IWayRepoPassword" value=""/>
    <config-property name="logLevel" value="debug"/>
  </connector-factory>
  <connector-factory location="eis/OracleJCAAdapter/DefaultConnection2"
connector-name="IWAFJCA10">
    <config-property name="IWayHome" value="../../adapters/application"/>
    <config-property name="IWayConfig" value="jca_sample2"/>
    <config-property name="IWayRepoURL" value=""/>
    <config-property name="IWayRepoUser" value=""/>
    <config-property name="IWayRepoPassword" value=""/>
    <config-property name="logLevel" value="debug"/>
  </connector-factory>
</oc4j-connector-factories>
```

How to Write a Java Application Client Using the CCI API

The following example shows the code structure for using CCI with packaged application adapters. The code sample is shown in four steps.

Step 1. Obtain the Connection Factory

The connection factory is obtained by JNDI lookup.

```
InitialContext context = new InitialContext();
ConnectionFactory cf = (ConnectionFactory) context.lookup(iwayJndi)
```

Step 2. Obtaining a Connection for the Adapter

IWAFConnectionSpec is an implementation of ConnectionSpec used for creating a design time or runtime service adapter connection. The ConnectionSpec has seven parameters. Connection Pooling is fully supported and established based on these parameters, except log level.

Parameter Name	Description
adapterName	Name of the packaged application adapter.
config -	Adapter configuration name. NOT REQUIRED FOR IWAEAdapter.
language	Default is en.
country	Default is us.

Parameter Name	Description
userName	User name. If provided, it overwrites configuration.
password	Password. If provided, it overwrites configuration.
logLevel	It overwrites the level set by the ManagedConnectionFactory property.

Note: Currently the OracleAS Adapter J2CA supports only basic security mapping. The DEBUG log level provides detailed information on the mapping behavior. It functions as follows:

- If the userName and password are not set, and no security is provided by the application server, the OracleAS Adapter J2CA will still let it pass and rely on the adapter configuration security information.
 - If userName and password are set, these values will overwrite the adapter configuration. The OracleAS Adapter J2CA compares this information with the security information provided by the application server and log in case the values do not match. However, it still allows the information through.
-

The `iWAFConnectionSpec` can be made to initiate an interaction with SAP by specifying the adapter name and configuration parameters in the `ConnectionSpec`. For example,

```
iWAFConnectionSpec cs = new IWAFConnectionSpec();
cs.setAdapterName(ADAPTER);
cs.setConfig(TARGET);
cs.setLogLevel(LOG_LEVEL); // Adapter layer log level
Connection c = cf.getConnection(cs); // where cf is the connection factory
```

In this snippet, `ADAPTER` and `TARGET` refer to the adapter being deployed and the name of a target defined in Application Explorer, respectively. See ["Complete Code Sample"](#) on page 3-6 for more information.

Step 3. Create Interaction with InteractionSpec for Runtime

```
Interaction i = c.createInteraction();
IWAFInteractionSpec is = new IWAFInteractionSpec();
is.setFunctionName(IWAFInteractionSpec.PROCESS);
```

Two functions can be set: `PROCESS` and `IWAE`. `PROCESS` is used at runtime. `IWAE` is used when you are using the `IAEAdapter` at design time.

Step 4. Create Input Record and Execute Interaction

In this case, to complete the EIS invocation, an SAP RFC message is referenced. The schema is provided by Application Explorer.

A standard J2CA Indexed Record is used in this example:

```
// Use JCA IndexRecord, named "input" for runtime processing.
IndexedRecord rIn = cf.getRecordFactory().createIndexedRecord("input");
rIn.add(msg_run);
IndexedRecord rOut = (IndexedRecord)i.execute(is, rIn);
```

```
System.out.println((String)rOut.get(0));
```

A special record is supported in this example:

```
//IWAFFRecord rIn = new IWAFFRecord("input");
//rIn.setRootXML(msg_run);
//IWAFFRecord response = executeRunInteraction(c, rIn);
//IWAFFRecord rOut = (IWAFFRecord)i.execute(is, rIn);
//System.out.println(rOut.getRootXML());
```

Where `msg_run` is an instance XML document generated from the schema created by Application Explorer. For example, the following is a sample SAP request XML document.

```
<?xml version="1.0" encoding="UTF-8"?>
<BAPI_CUSTOMER_GETDETAIL2>
<COMPANYCODE></COMPANYCODE>
<CUSTOMERNO>0000401026</CUSTOMERNO>
</BAPI_CUSTOMER_GETDETAIL2>
```

Complete Code Sample

The following is a sample of the complete code:

```
import javax.resource.cci.*;
import com.ibi.afjca.cci.*;
import com.ibi.afjca.spi.*;

/**
 * The purpose of this sample is to illustrate how to use the IWAF Universal
 * JCA connector.
 */
public class IWAFJCASimple {

    private static String HOME    = "c:/iway/xfoc/components/iwafcont/dist";
    private static String CONFIG  = "base";
    private static String LOG_LEVEL = "FATAL";

    private static String ADAPTER = "SAP";
    private static String TARGET  = "SAP_connection";

    // Input Message
    private static String msg_run = "<SAP/>";

    public static void main(String[] args) throws Exception {

        // 1. Getting the Connection factory through JNDI lookup
        // -----
        InitialContext context = new InitialContext();
        ConnectionFactory cf = (ConnectionFactory)context.lookup(iwayJndi)
        // 2. Getting a connection for a particular adapter target, in this case SAP
        // -----
        IWAFConnectionSpec cs = new IWAFConnectionSpec();
        cs.setAdapterName(ADAPTER);
        cs.setConfig(TARGET);
        cs.setLogLevel(LOG_LEVEL); // Adapter layer log level
        Connection c = cf.getConnection(cs); // where cf is the connection factory

        // 3. Create interaction with interactionSpec for RUNTIME
        // -----
        Interaction i = c.createInteraction();
```

```
IWAFInteractionSpec is = new IWAFInteractionSpec();
is.setFunctionName("PROCESS");

// 4. Create input Record and execute interaction
// -----

// 4.1 Using JCA standard Indexed Record
// Use JCA IndexRecord, named "input" for runtime processing.
IndexedRecord rIn = cf.getRecordFactory().createIndexedRecord("input");
rIn.add(msg_run);
IndexedRecord rOut = (IndexedRecord)i.execute(is, rIn);
System.out.println((String)rOut.get(0));

// 4.2 Our own Record is supported here
//IWAFRecord rIn = new IWAFRecord("input");
//rIn.setRootXML(msg_run);
//IWAFRecord response = executeRunInteraction(c, rIn);
//IWAFRecord rOut = (IWAFRecord)i.execute(is, rIn);
//System.out.println(rOut.getRootXML());

} // main()

}
```

Integration with BPEL Process Manager

OracleAS Adapter for SAP integrates seamlessly with Business Process Execution Language (BPEL) Process Manager to facilitate Web service integration. BPEL Process Manager is based on the Service-Oriented Architecture (SOA). It consumes adapter services exposed as Web Service Definition Language (WSDL) documents.

This chapter includes the following topics:

- [Overview of Adapter Integration with BPEL Process Manager](#)
- [Deployment of Adapter](#)
- [Design Time](#)
- [Invoking Adapter Request-Response Service from BPEL Process Manager](#)
- [Listening to Adapter Events Inside BPEL Process Manager](#)

Overview of Adapter Integration with BPEL Process Manager

To integrate with BPEL Process Manager, OracleAS Adapter for SAP must be deployed in the same OC4J container as BPEL Process Manager. The underlying adapter services must be exposed as WSDL files, which are generated during design time in Oracle Application Server Adapter Application Explorer (Application Explorer) for both request-response (outbound) and event notification (inbound) services of the adapter. See [Generating Web Service Definition Language \(WSDL\) \(J2CA Configurations Only\)](#) on page 2-15 for more information.

The generated WSDL files are used to design the appropriate BPEL processes for inbound or outbound adapter services. A completed BPEL process must be successfully compiled in a BPEL designer and deployed to a BPEL server. Upon deployment to the BPEL server, every newly built process is automatically deployed to the Oracle BPEL Console, where you run, monitor, and administer BPEL processes, as well as listen to adapter events.

See Also:

- *Oracle Application Server Adapter Concepts*
- *Oracle BPEL Process Manager Developer's Guide*

Deployment of Adapter

During installation, OracleAS Adapter for SAP is deployed as a J2CA 1.0 resource adapter within the OC4J J2CA container. The adapter must be deployed in the same OC4J container as BPEL Process Manager.

See Also: *Oracle Application Server Adapter Concepts*

Design Time

The following tools are required to complete your adapter design-time configuration:

- OracleAS Adapter Application Explorer (Application Explorer)
- Oracle JDeveloper BPEL Designer (JDeveloper) or Eclipse

Note: The examples in this chapter demonstrate the use of JDeveloper.

Before you design a BPEL process, you must create a schema and generate the respective WSDL file using Application Explorer. See [Generating Web Service Definition Language \(WSDL\) \(J2CA Configurations Only\)](#) on page 2-15 for more information.

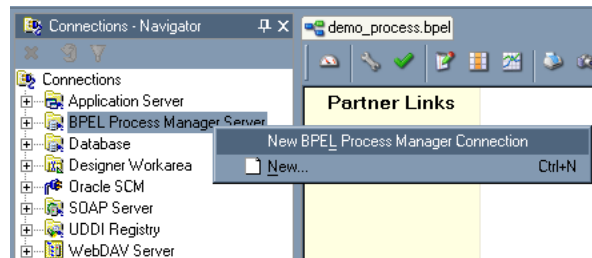

Design a BPEL Process for Request-Response Service (Outbound)

An outbound BPEL process consists of PartnerLink, Invoke, and Assign process activities. You must first create a new BPEL Process Manager connection and a synchronous BPEL process template.

Create a New Connection to BPEL PM Server

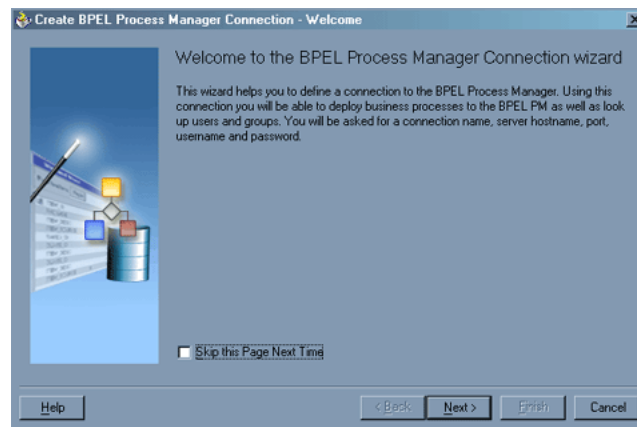

To create a new BPEL Process Manager connection:

1. To display the connections, click the **Connections** tab at the bottom of the upper left pane in JDeveloper.

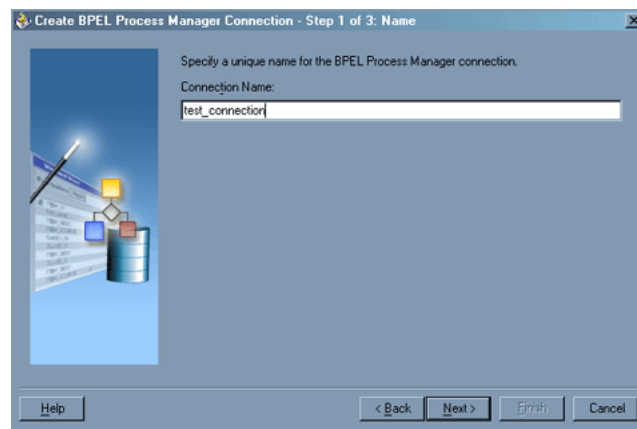

2. Right-click **BPEL Process Manager Server** and select **New BPEL Process Manager Connection**.

The Create BPEL Process Manager Connection - Welcome dialog box is displayed.

3. Click **Next**.

The Create BPEL Process Manager Connection dialog box is displayed.

4. Specify a unique name for your BPEL Server connection and click **Next**.

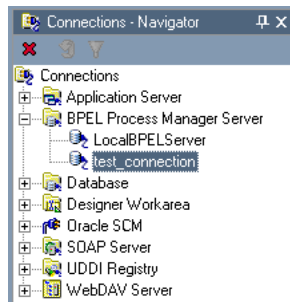

The Create BPEL Process Manager Connection dialog box is displayed.

5. Specify a valid host name and port number for the BPEL PM Server you wish to connect to.

6. Click **Finish**.

Your newly created server connection is displayed in the Connections tab under the BPEL Process Manager Server node.

Create a New BPEL Project for Outbound Interaction (Synchronous Process)

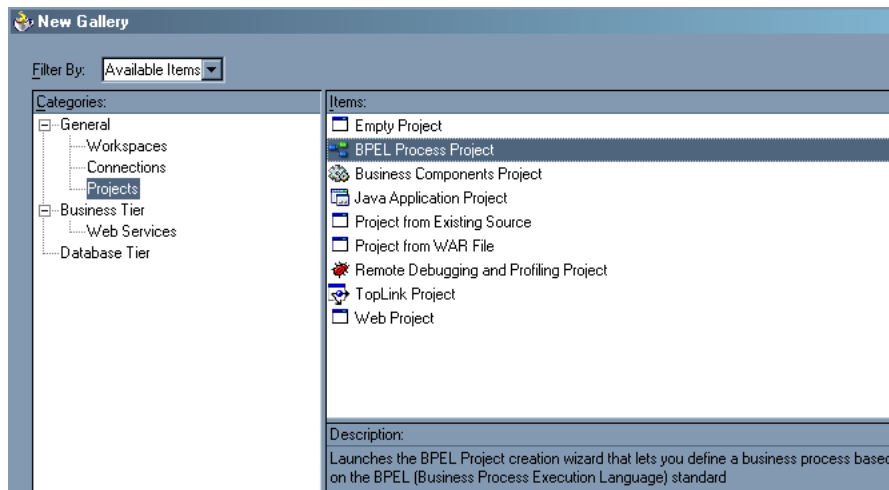

To create a new BPEL project for a synchronous process:

1. At the bottom of the upper left pane, click the **Applications** tab and select a workspace for your project.

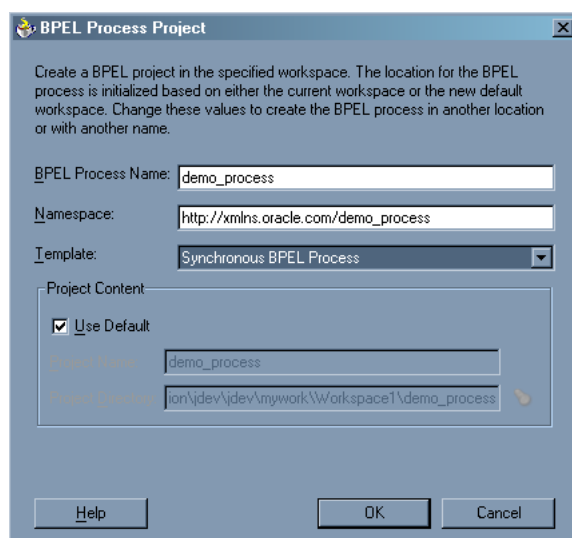

2. Right-click the workspace and select **New Project**.

The New Gallery window is displayed.

3. From the Items list, select **BPEL Process Project** and click **OK**.

The BPEL Process Project dialog box is displayed.

4. Perform the following steps:
 - a. Specify a name for the BPEL process.
The Namespace field is updated automatically.
 - b. From the Template drop-down list, select **Synchronous BPEL Process**.
5. Click **OK**.

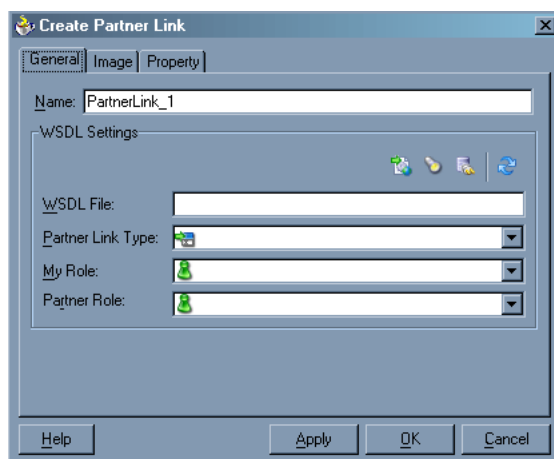

Create an Outbound PartnerLink Activity

When designing a BPEL process, a PartnerLink activity must be created to invoke the SAP service. A PartnerLink describes a set of operations within a Web service. The WSDL document is the external contract to which the Web service conforms. Given a WSDL, any BPEL process can initiate a Web service through a PartnerLink.

To create an outbound PartnerLink using the WSDL file you generated in Application Explorer:

1. From the Process Activities pane on the right, drag and drop a PartnerLink to the visual editor.

The Create Partner Link dialog box is displayed.

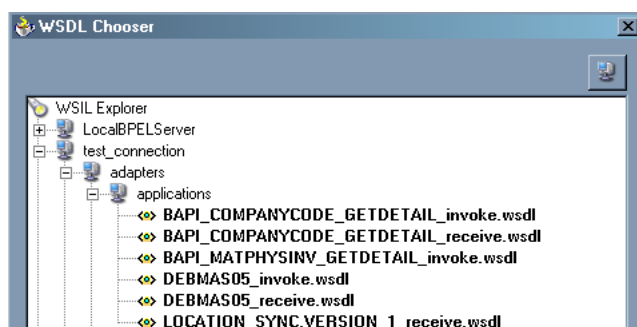

- Click the **WSIL browser** icon (second icon from the left the **WSDL File** field).

The WSDL Chooser dialog box is displayed.

- Expand your new connection, then expand **adapters**, and then **applications**.

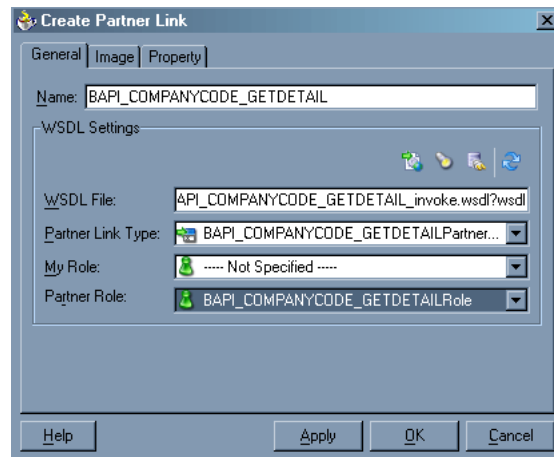

The WSDL tree displayed in the WSDL Chooser dialog box lists any WSDL files you have created using Application Explorer. The WSDL tree is generated by a WSDL servlet, which is automatically deployed as part of the BPEL Server installation.

Note: If you have organized your WSDL files in subfolders, the WSIL browser will display the full tree structure of your WSDL hierarchy. By default, the names of all WSDL files generated for outbound adapter services end with `_invoke`.

- Select **BAPI_COMPANYCODE_GETDETAIL_invoke.wSDL** and click **OK**.

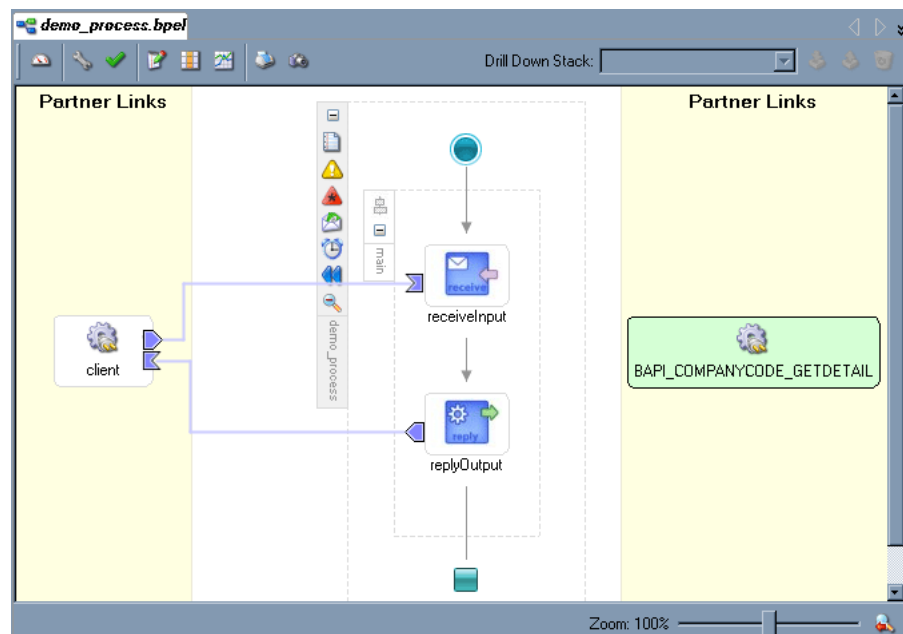

The **WSDL File** field in the Create Partner Link dialog box displays the name and location of the selected WSDL file. The **Partner Link Type** field specifies the PartnerLink defined in the WSDL file.

Perform the following steps:

- a. Leave the **My Role** field unspecified. The role of the PartnerLink is null, as it will be synchronously invoked from the BPEL process.
 - b. From the **Partner Role** drop-down list, select the default value **BAPI_COMPANYCODE_GETDETAILRole**. This is the role of the BPEL process.
5. Click **OK**.

The new PartnerLink appears in the visual editor.

6. Select **Save** from the **File** menu.

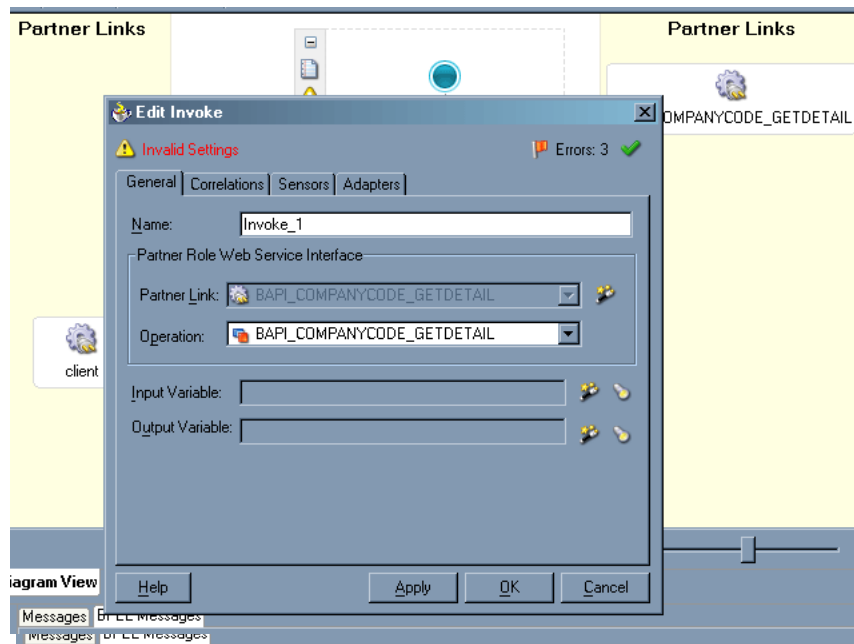

Create an Outbound Invoke Activity

This activity enables you to specify an operation you want to invoke for the service identified by its PartnerLink. The Invoke activity opens a port in the process that is used to send and receive data. It uses this port to submit required data and receive a response. For synchronous callbacks, only one port is needed for both the send and the receive functions.

To create an outbound Invoke activity:

1. From the **Process Activities** pane on the right, drag an **Invoke** activity to the visual editor and place it between the Receive activity (`receiveInput`) and the Reply activity (`replyOutput`).
2. Extend a connection between the Invoke activity and your newly-created PartnerLink.

The Edit Invoke dialog box is displayed. Note that the Partner Link and Operation fields are automatically populated with your WSDL files.

Note: Ignore any invalid settings and error warnings.

Perform the following steps:

- a. In the **Name** field, provide a meaningful name for the Invoke activity.
- b. Click the first icon to the right of the **Input Variable** field, then click **OK** in the Create Variable window that is displayed.

A global variable is automatically created in the Input Variable field.

- c. Click the first icon to the right of the **Output Variable** field, then click **OK** in the Create Variable window that is displayed.

A global variable is automatically created in the Output Variable field.

- d. Click **Apply**.

The Edit Invoke window should no longer display any warnings or errors.

3. Click **OK**.
4. Select **Save** from the **File** menu.

Create an Assign Activity

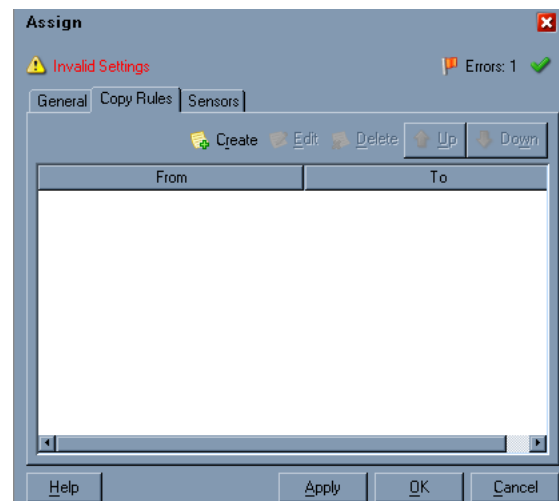

An Assign activity provides a method for simple data manipulation, such as copying the contents of one variable to another. This Assign activity maps the input variable of the SAP process to the SAP PartnerLink input.

To create an Assign activity:

1. From the **Process Activities** pane on the right, drag an **Assign** activity to the visual editor and place it between the Receive activity (`receiveInput`) and the new Invoke activity (`GetCompanyDetail`).

2. Double-click the **Assign** activity icon.

The Assign dialog box is displayed.

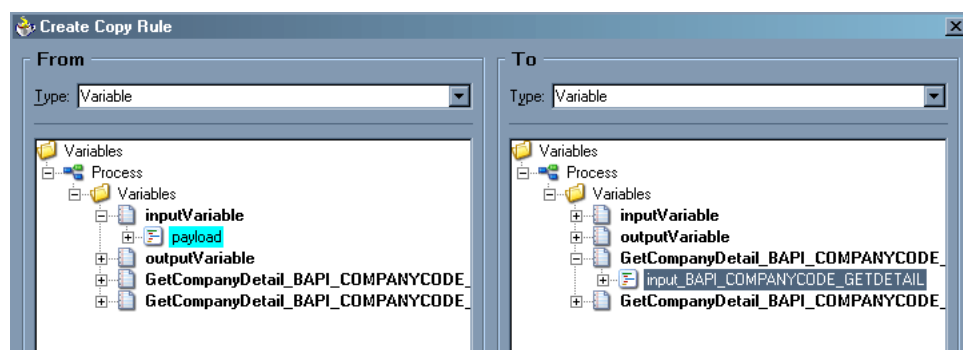

Note: Ignore any invalid settings and error warnings.

3. In the Copy Rules tab, click **Create**.

The Create Copy Rule dialog box is displayed.

- a. In the **From** pane, expand **Variables**, then **inputVariable**, and then highlight **payload**.
- b. In the **To** pane, expand **Variables**, then **GetCompanyDetail_BAPI_COMPANYCODE_GETDETAIL_InputVariable**, and then highlight **input_BAPI_COMPANYCODE_GETDETAIL**.

Your Create Copy Rule dialog box should look as follows:

4. To close the Create Copy Rule dialog box and the Assign dialog box, click **OK**.

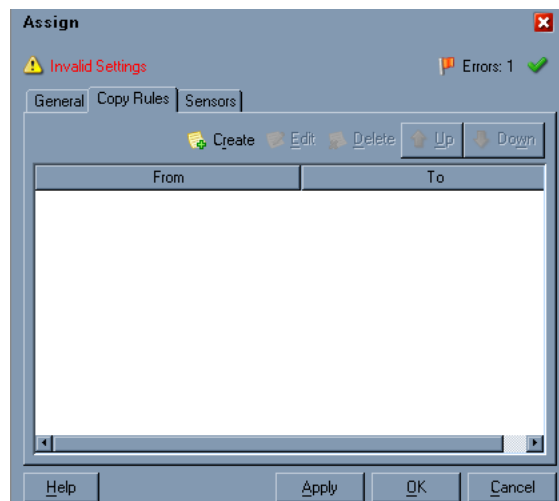

Create a Second Assign Activity

This Assign activity maps the output variable of the SAP process to the SAP PartnerLink output.

To create a second Assign activity:

1. From the **Process Activities** pane on the right, drag another **Assign** activity to the visual editor and place it between the Invoke activity (GetCompanyDetail) and the Reply activity (replyOutput).
2. Double-click the **Assign** activity icon.

The Assign settings dialog box is displayed.

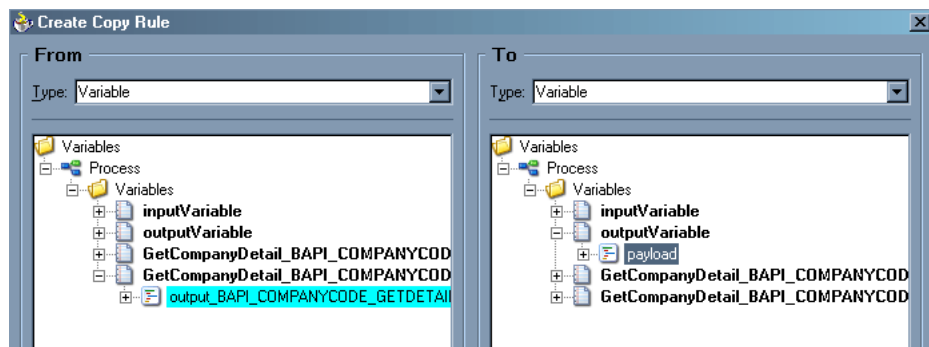

Note: Ignore any invalid settings and error warnings.

3. In the Copy Rules tab, click **Create**.

The Create Copy Rule dialog box is displayed. Perform the following steps:

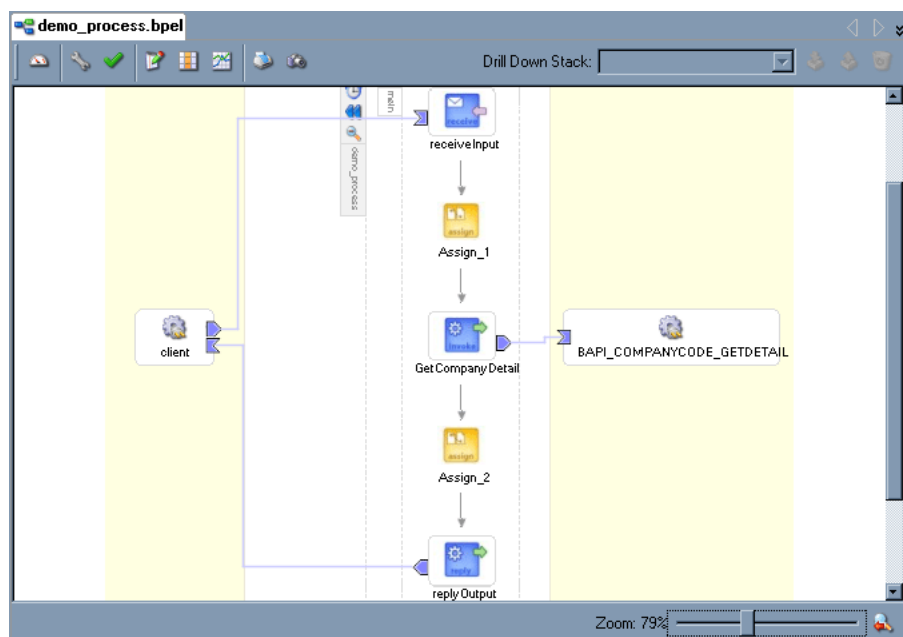

- a. In the **From** pane, expand **Variables**, then **GetCompanyDetail_BAPI_COMPANYCODE_GETDETAIL_OutputVariable**, and then highlight **output_BAPI_COMPANYCODE_GETDETAIL**.
- b. In the **To** pane, expand **Variables**, then **outputVariable**, and then highlight **payload**.

Your Create Copy Rule dialog box should look as follows:

4. To close the Create Copy Rule dialog box and the Assign dialog box, click **OK**.
5. Select **Save** from the **File** menu.

The following image shows the diagram view of your completed BPEL process.

See [Invoking Adapter Request-Response Service from BPEL Process Manager](#) on page 4-17 for information on how to deploy and manage your outbound process.

See Also:

- *Oracle BPEL Process Manager Developer's Guide*
- *Oracle Application Server Adapter Concepts*

Design a BPEL Process for Event Handling (Inbound)

An inbound BPEL process consists of a PartnerLink and a Receive process activity. You must first create a channel and a new BPEL Process Manager Server connection. See [Chapter 5, "BPEL Process Manager Integration Examples"](#) for complete instructions on how to perform these procedures.

Note: You must create a separate channel for every inbound J2CA service and select that channel when you generate WSDL for inbound interaction using Application Explorer. Do not start the channel in Application Explorer, as BPEL Process Manager manages endpoint activation independently. See [SAP Event Integration](#) on page 5-1 for more information.

Create a New BPEL Project for Inbound Interaction (Empty Process)

Before you create a BPEL project, verify that your BPEL Server is running. After you have created a new server connection, you are ready to design an empty process template for your BPEL project.

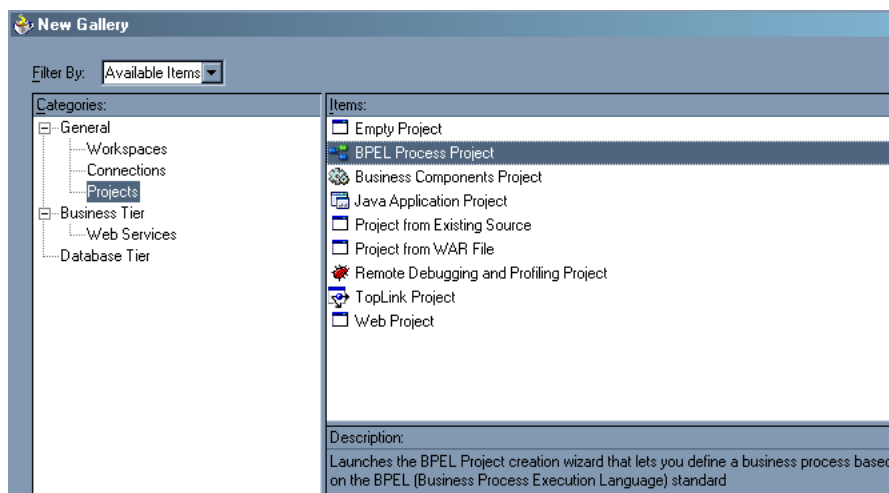

To create a new BPEL project for inbound interaction:

1. Click the **Applications** tab and select a workspace for your project.

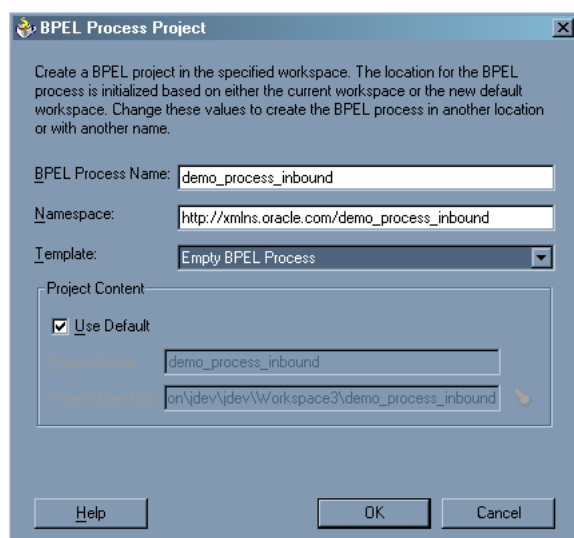

2. Right-click the workspace and select **New Project**.

The New Gallery window is displayed.

3. From the Items list, select **BPEL Process Project** and click **OK**.

The BPEL Process Project dialog box is displayed.

4. Perform the following steps:
 - a. Specify a name for the process.
The Namespace field is updated automatically.
 - b. From the Template drop-down list, select **Empty BPEL Process**.
 - c. Click **OK**.

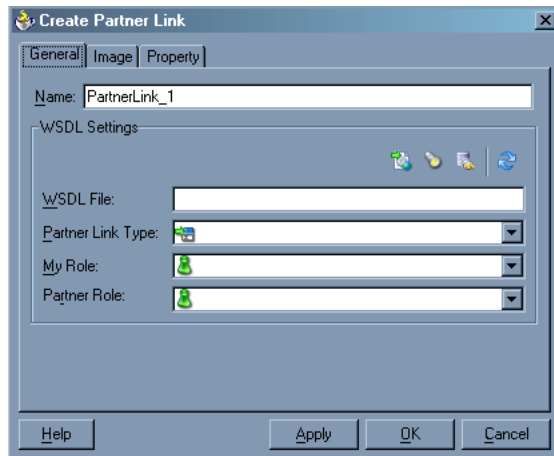

Create an Inbound PartnerLink Activity

When designing a BPEL process, a PartnerLink activity must be created to invoke the SAP service. A PartnerLink describes a set of operations within a Web service. The WSDL document is the external contract to which the Web service conforms. Given a WSDL, any BPEL process can initiate a Web service through a PartnerLink.

To create an inbound PartnerLink using the WSDL file you generated in Application Explorer:

1. From the Process Activities pane on the right, drag and drop a PartnerLink to the visual editor.

The Create Partner Link dialog box is displayed.

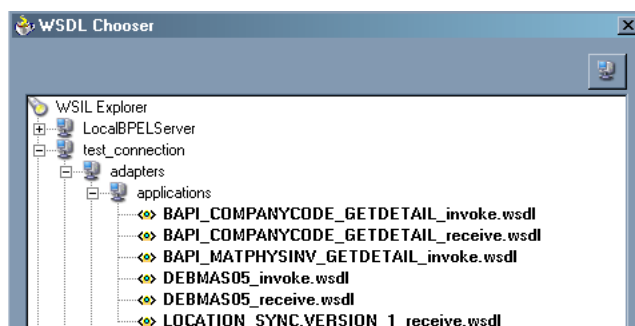

2. Click the **WSIL browser** icon (second icon from the left the **WSDL File** field).

The WSDL Chooser dialog box is displayed.

3. Expand your new connection, then expand **adapters**, and then **applications**.

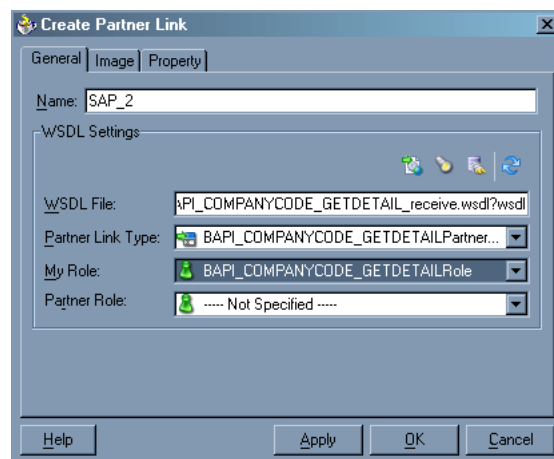

The WSDL tree displays the WSDL files you created using Application Explorer. The WSDL tree is generated by a WSDL servlet, which is automatically deployed as part of the BPEL Server installation.

Note: If you have organized your WSDL files in subfolders, the WSIL browser will display the full tree structure of your WSDL hierarchy. By default, the names of all WSDL files generated for inbound adapter services end with `_receive`.

4. Select **BAPI_COMPANYCODE_GETDETAIL_receive.wSDL** and click **OK**.

The Create Partner Link dialog box is displayed.

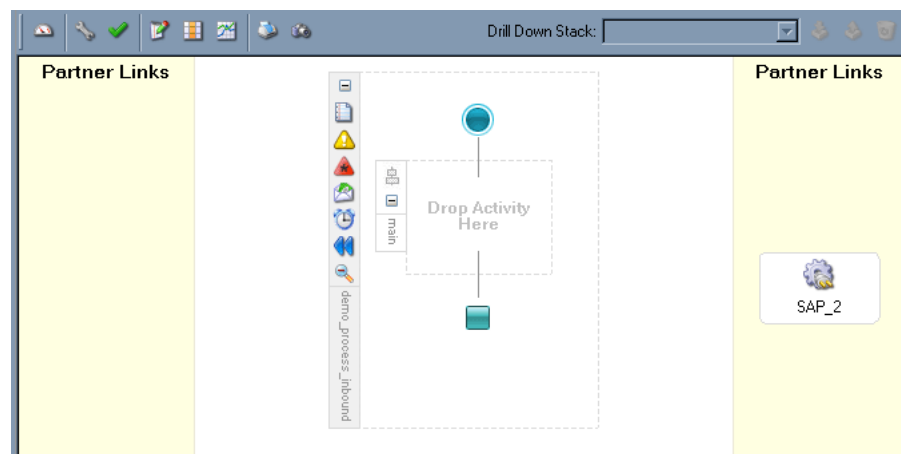

The **WSDL File** field displays the name and location of the selected WSDL file. The **Partner Link Type** field specifies the PartnerLink defined in the WSDL file.

Perform the following steps:

- a. From the **My Role** drop-down list, select the default value **BAPI_COMPANYCODE_GETDETAILRole**.
 - b. Leave the **Partner Role** field unspecified.
5. Click **Apply**, and then **OK**.

The new SAP_2 PartnerLink appears in the visual editor.

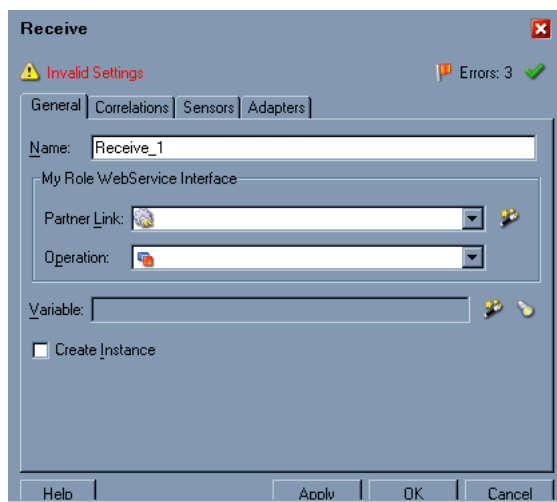

6. Select **Save** from the **File** menu.

Create an Inbound Receive Activity

To create an inbound Receive Activity:

1. From the **Process Activities** pane on the right, drag a **Receive** activity to the visual editor and place it in the designated placeholder labeled **Drop Activity Here**.
2. Double-click the **Receive** activity.

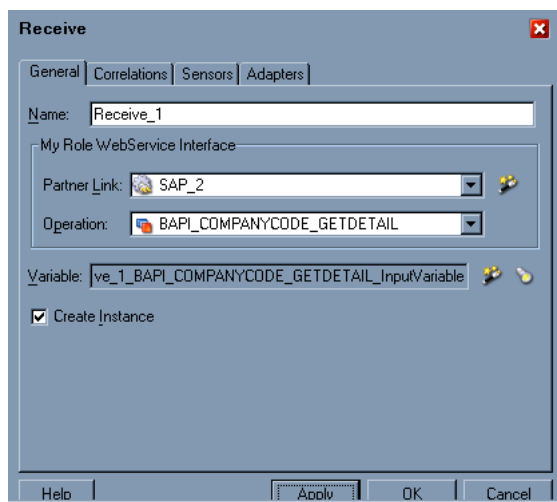

The Receive dialog box is displayed.

Perform the following steps:

- a. From the **Partner Link** drop-down menu, select the PartnerLink you created in the previous step.
The **Operation** field is automatically populated.
 - b. Click the first icon to the right of the **Variable** field, then click **OK** in the Create Variable dialog box that is displayed.
 - c. Verify that the **Create Instance** check box is selected.
3. Click **Apply**.

The Receive dialog box should no longer display any warnings or errors.

4. Click **OK**.

A connection is created between the PartnerLink and the Receive activity. You have completed the design of your inbound BPEL process.

See [Listening to Adapter Events Inside BPEL Process Manager](#) on page 4-20 for information on how to deploy and manage your inbound process.

Invoking Adapter Request-Response Service from BPEL Process Manager

The OracleAS Adapter for SAP request-response service is used to create, delete, update, and query back-end data as well as to call back-end workflows and transactions. The following section describes how to invoke the adapter synchronous request-response service, also referred to as Outbound Interaction, as well as how to manage the process in Oracle BPEL Console.

Deploy the Outbound BPEL Process

The procedures for deploying an inbound and an outbound BPEL process using the JDeveloper interface are identical.

To deploy your BPEL process in JDeveloper:

1. Right-click your process flow in the Applications - Navigator pane.
2. Select **Deploy > Your BPEL PM Server connection > Deploy to default domain**.

The Password Prompt dialog box is displayed.

3. In the **Domain Password** field, enter your BPEL Process Manager password.

The deployment process starts automatically after you enter the correct password.

4. Observe the **Messages** log on the bottom of the window.

The Messages log displays the deployment status. In this example, it shows a successful deployment message for the process.

If deployment was not successful, click the **Compiler** tab to view all error and warning messages generated during the deployment process.

Manage the Deployed Outbound Process in Oracle BPEL Console

JDeveloper deploys the developed process directly to the Oracle BPEL Console, which enables you to run, monitor, and administer BPEL processes.

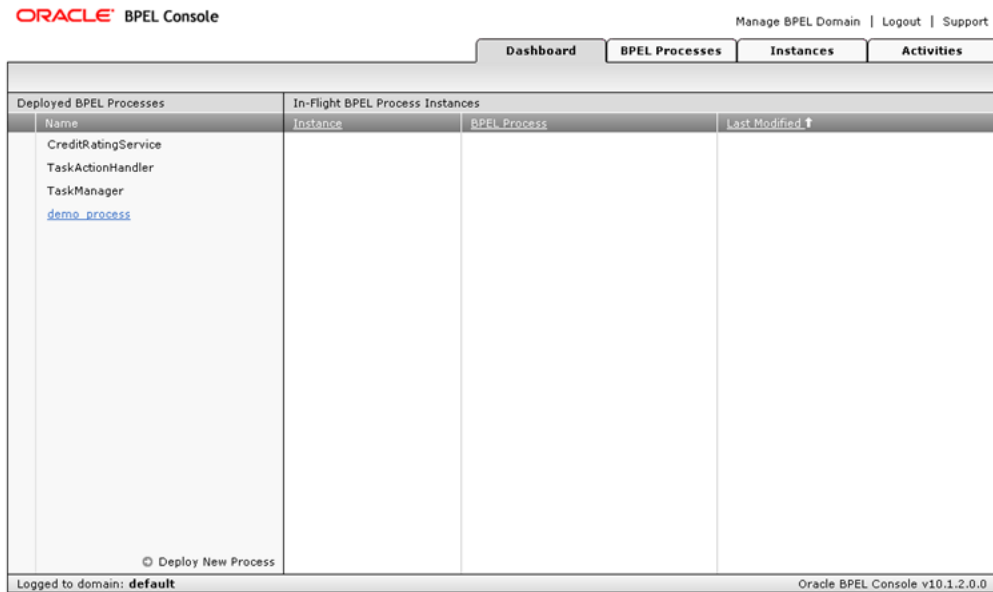

To invoke adapter request-response service:

1. Start the Oracle BPEL Console by entering the following URL in a browser:

`http://host:port/BPELConsole`

2. Select a domain and provide a valid password.

The Oracle BPEL Console main page is displayed. All deployed BPEL processes are listed in the Dashboard tab.

5. Click the **Initiate** tab.

The Initiate tab enables you to test your BPEL process.

The screenshot shows the Oracle BPEL Console interface. At the top, there's a navigation bar with 'Dashboard', 'BPEL Processes', 'Instances', and 'Activities'. Below this, the 'Initiate' tab is selected. The main area is titled 'Testing this BPEL Process'. It includes a dropdown menu for 'Initiating a test instance' set to 'XML Source'. Below this is a text area containing XML code. At the bottom, there are three checkboxes: 'Save as default input', 'Add optional message header properties', and 'Perform stress test'. A 'Post XML Message' button is at the bottom right.

Oracle BPEL Console

Manage BPEL Domain | Logout | Support

Dashboard BPEL Processes Instances Activities

BPEL Process: demo_process Version: 1.0 Lifecycle: Active
Statistics: 0 Open Instances | 0 Closed Instances

Manage Initiate Descriptor WSDL Sensors Source

Testing this BPEL Process

Initiating a test instance XML Source

To create a new 'test' instance of this BPEL Process, fill the following text area with the XML representation of the input message and click on the 'Post XML Message' button.

```
<?xml version="1.0" encoding="UTF-8"?>
<CompanyCode.GetDetail SERVICENAME="CompanyCodeGetDetail"
METHODNAME="BAPI_COMPANYCODE_GETDETAIL" LICENSE="test" CompanyCodeId="1000"/>
```

☐ Save as default input
☐ Add optional message header properties
☐ Perform stress test

Post XML Message

Perform the following steps:

- a. From the **Initiating a test instance** drop-down menu, select **XML Source**.
- b. Enter the following code in the text area provided for XML input:

```
<?xml version="1.0" encoding="UTF-8"?>
<CompanyCode.GetDetail SERVICENAME="CompanyCodeGetDetail" METHODNAME="BAPI_
COMPANYCODE_GETDETAIL" LICENSE="test" CompanyCodeId="1000"/>
```

6. Click **Post XML Message**.

The response received from the SAP system is displayed in the Initiate window.

See Also: *Oracle Application Server Adapter Concepts*

Listening to Adapter Events Inside BPEL Process Manager

The OracleAS Adapter for SAP event notification service, also referred to as Inbound Interaction, is used to listen to events that occur in an EIS. The following section describes how to deploy your inbound BPEL process and listen to adapter events at runtime using Oracle BPEL Console.

Deploy the Inbound BPEL Process

The procedures for deploying an inbound and an outbound BPEL process using the JDeveloper interface are identical.

To deploy your BPEL process in JDeveloper:

1. Right-click your process flow in the Applications pane.
2. Select **Deploy > Your BPEL PM Server connection > Deploy to default domain**.

The Password Prompt dialog box is displayed.

3. In the **Domain Password** field, enter your BPEL Process Manager password.

The deployment process starts automatically after you enter the correct password.

4. Observe the **Messages** log on the bottom of the window.

The Messages log displays the deployment status. In this example, it shows a successful deployment message for the process.

If deployment was not successful, click the **Compiler** tab to view all error and warning messages generated during the deployment process.

Listen to Adapter Events in Oracle BPEL Console

JDeveloper deploys the developed process directly to Oracle BPEL Console, which enables you to run, monitor, and administer BPEL processes, as well as to listen to adapter events at runtime using Oracle BPEL Console.

To listen to adapter events:

1. Start the Oracle BPEL Console by entering the following URL in a browser:

`http://host:port/BPELConsole`

2. Select a domain and provide a valid password.

The Oracle BPEL Console Dashboard tab is displayed.

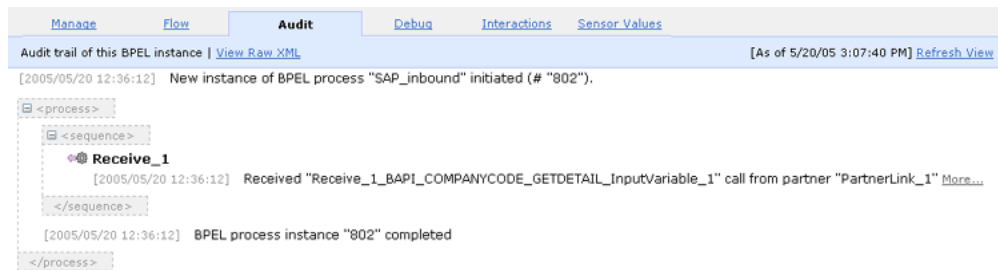

3. Click the **Instances** tab.

Upon receiving a runtime event, an instance of the event is displayed under the Instances tab.

	Dashboard	BPEL Processes	Instances	Activities
List of BPEL Process Instances 1 - 8				
	Instance	BPEL Process	Last Modified ↑	
✓	802 : Instance #802 of SAP_inbound	SAP_inbound (v. 1.0)	5/20/05 12:36:12 PM	
✓	801 : Instance #801 of demo_process_inbound	demo_process_inbound (v. 1.0)	5/20/05 12:35:55 PM	
✓	601 : Instance #601 of PSFT_inbound	PSFT_inbound (v. 1.0)	5/18/05 2:24:15 PM	

4. To see the event message, click the instance, and then click **Audit**.

The event message is displayed.

5. Click **More...** to view the entire message, or **View Raw XML** to view the XML source.

See [Chapter 5, "BPEL Process Manager Integration Examples"](#) on page 5-1 for more information.

See Also: *Oracle Application Server Adapter Concepts*

BPEL Process Manager Integration Examples

This chapter contains the following examples:

- [SAP Event Integration](#)
- [SAP Service Integration](#)

The event and service scenarios demonstrated in this chapter require the following prerequisites and configuration steps:

Prerequisites

- OracleAS Adapter for SAP deployed to Oracle Application Server.
- OracleAS Database adapter deployed and configured.
- Oracle BPEL PM Server properly configured and running.
- Oracle JDeveloper properly installed.

See Also: *Oracle Application Server Adapters Installation Guide*

Configuration Steps

The examples present all the configuration steps necessary for demonstrating service and event integration with SAP. See the following for more information:

1. Configure SAP for outbound processing. See [Appendix A, "Configuring SAP for Inbound and Outbound Processing"](#) for more information.
2. Create a J2CA configuration, as BPEL PM is only compatible with the J2CA Connector. See ["Creating a Configuration for J2CA"](#) on page 2-8 for more information.
3. Configure OracleAS Adapter for SAP for services and events. See [Chapter 2, "Configuring OracleAS Adapter for SAP"](#) for more information.

SAP Event Integration

This topic illustrates how OracleAS Adapter for SAP integrates with SAP to receive event data. The procedures describe design time and runtime. The example demonstrates how OracleAS Adapter for SAP integrates with SAP to receive event data. In this example, an SAP event occurs when a customer record is added to an SAP system.

The design time and runtime procedures are outlined in the following sections.

Design Time

Creating a Channel

You must create a separate channel for every inbound J2CA service and select that channel when you generate WSDL for inbound interaction using Application Explorer.

Note: If more than one inbound service share the same channel, event messages will not be delivered to the right BPEL process.

To create a channel:

1. Start **Application Explorer** and connect to a J2CA configuration.
2. In the left pane, expand the **Events** node.
3. Expand the **SAP** node.

The Ports and Channels nodes appear in the left pane.

4. Right-click **Channels** and select **Add Channel**.

The Add Channel dialog box is displayed.

Perform the following steps:

- a. Enter a name for the channel, for example, `SAP_Channel1`.
- b. Enter a brief description (optional).
- c. From the **Protocol** list, select **SAP Channel--App Server**.
5. Click **Next**.

The Application Server dialog box is displayed.

The screenshot shows the 'Application Server' dialog box with the 'System' tab selected. The dialog has three tabs: 'System', 'User', and 'Advanced'. The 'System' tab contains five text input fields, each followed by an asterisk to indicate it is required: 'Gateway host*', 'Gateway service*', 'Program ID of the server*', 'Application Server*', and 'System number*'. At the bottom of the dialog are 'OK' and 'Cancel' buttons. A red text label at the bottom left states 'Fields marked with * are required.'

The following tabs are available:

- System (Required)
- User (Required)
- Advanced

6. In the **System** tab, enter the appropriate information for your SAP channel, based on the information in the following table.

Table 5–1 System Tab Parameters

Target Parameter	Description
Gateway host	A host name for the SAP Gateway.
Gateway service	A service for the SAP Gateway.
Program ID of the server	An SAP program ID you want to use for this channel.
Application Server	A host name for the application server.
System number	A system number for SAP.

7. Click the **User** tab.

The screenshot shows the 'Application Server' dialog box with the 'User' tab selected. The dialog has three tabs: 'System', 'User', and 'Advanced'. The 'User' tab contains five text input fields: 'Client*', 'User*', 'Password*', 'Language' (with 'EN' entered), and 'Codepage'. At the bottom of the dialog are 'OK' and 'Cancel' buttons. A red text label at the bottom left states 'Fields marked with * are required.'

8. For the **User** tab, enter the appropriate information for your SAP channel, based on the information in the following table.

Table 5–2 User Tab Parameters

Target Parameter	Description
Client	The client number defined for the SAP application for client communications.
User	A valid user ID for the SAP application.
Password	A valid password for the SAP application.
Language	A language key. EN (English) is the default.
Code page	A character code page value.

9. For the **Advanced** tab (optional), enter the appropriate information for your SAP channel, based on the information in the following table.

Table 5–3 Advanced Tab Parameters

Target Parameter	Description
IDoc Format	Select an IDoc enter from the list.
User Defined Function Modules	Enter the path to the user-defined function module you created.
SAP trace	Select this check box if you want to enable SAP traces for troubleshooting purposes.
Unicode	Select this check box if you are expecting your response in Unicode format.
Synchronous Processing	Select the type of synchronous processing from the list.

10. Click **OK**.

The channel appears under the channels node in the left pane. An X over the icon indicates that the channel is currently disconnected.

Note: Do not start the channel, as it is managed by BPEL PM Server. If you start the channel for testing and debugging purposes, stop it before runtime.

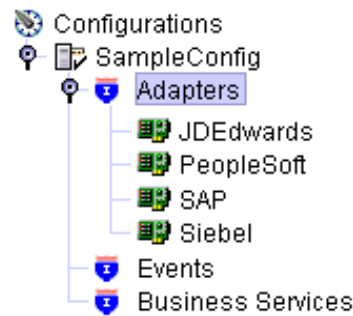

Creating an Event

After you create a channel and verify that it is not started, you must create an event using Application Explorer.

To establish a connection to the SAP system and locate DEBMA05:

1. Start Application Explorer.
2. Expand the **Adapters** node.

A list of all adapters is displayed.

Perform the following steps:

- a. Expand the **SAP** node.

A list of your available targets is displayed.

- b. Click a target name under the **SAP** node, for example, **SAPTarget**.

The Connection dialog box displays the saved parameters.

3. Verify your connection parameters.
4. Provide the required password.
5. Right-click the target name and select **Connect**.

The x icon disappears, indicating that the node is connected.

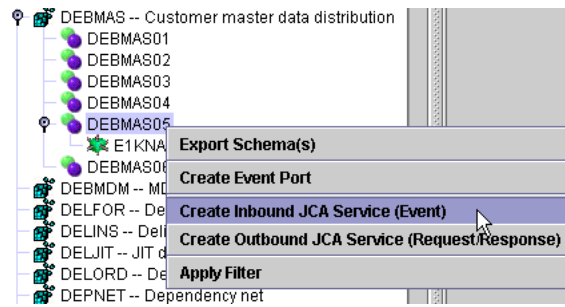

6. Expand the **ALE(IDOCS)** node and select **DEBMAS**.

The DEBMAS list is displayed.

7. Right-click **DEBMAS05** from the **DEBMAS** list.

8. Select **Create Inbound JCA Service (Event)**.

The Export WSDL dialog box is displayed.

Perform the following steps:

- a. In the **WSDL File Name** field, specify a name and location of the WSDL file.
- b. In the **Channel** field, select the channel you created for this inbound service.

Note: You must create a separate channel for every inbound service. Verify that the channel is stopped before runtime.

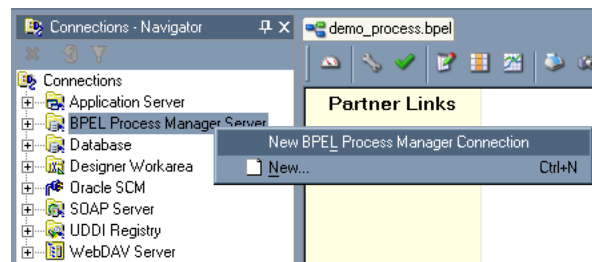

9. Click **OK**.

Creating a BPEL PM Server Connection

Before you design an inbound BPEL process, you must create a connection to your BPEL Server using JDeveloper. To create a server connection:

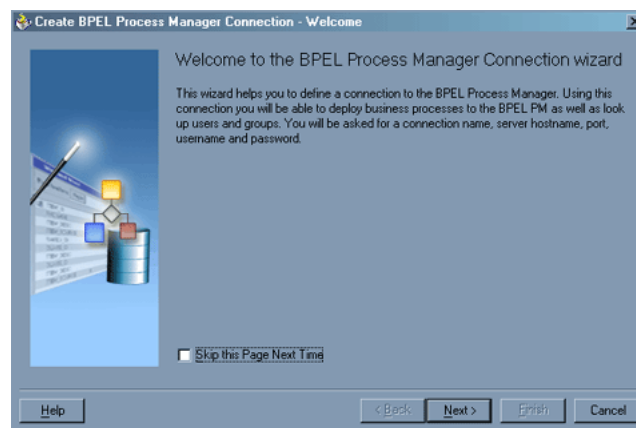

1. Open **JDeveloper**.
2. To display the connections, click the **Connections** tab at the bottom of the upper left pane in JDeveloper.

The following menu is displayed.

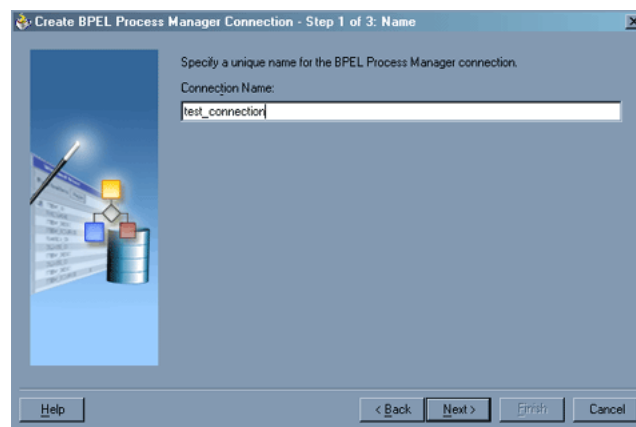

3. Right-click **BPEL Process Manager Server** and select **New BPEL Process Manager Connection**.

The Create BPEL Process Manager Connection - Welcome dialog box is displayed.

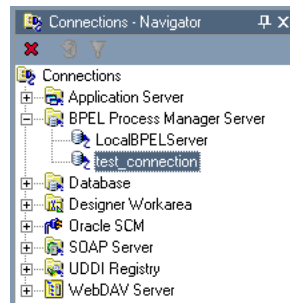

4. Click **Next**.

The Create BPEL Process Manager Connection dialog box is displayed.

5. Specify a unique name for your BPEL Server connection and click **Next**.
6. Specify a valid host name and port number for the BPEL PM Server you wish to connect to.
7. Click **Finish**.

Your newly created server connection is displayed in the Connections tab under the BPEL Process Manager Server node.

Designing the BPEL Process for the SAP_DEBMAS05 Inbound Service

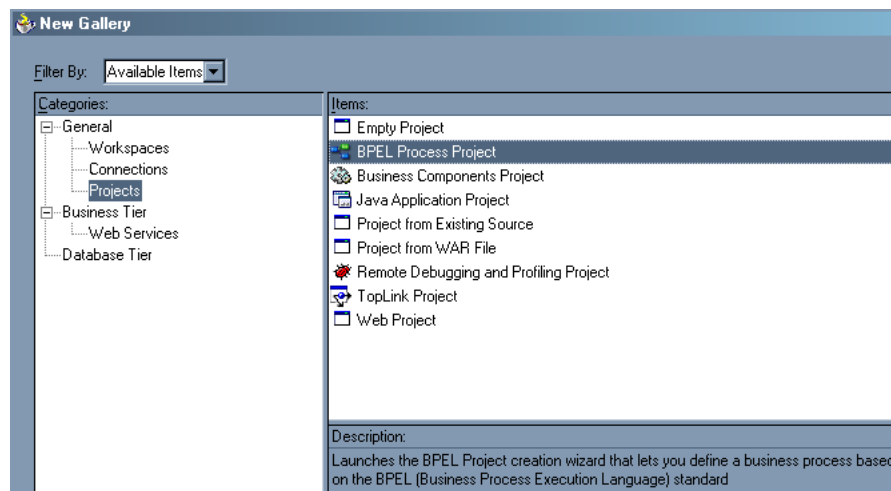

To design a BPEL process for inbound interaction:

1. Click the **Applications** tab and select a workspace for your project.

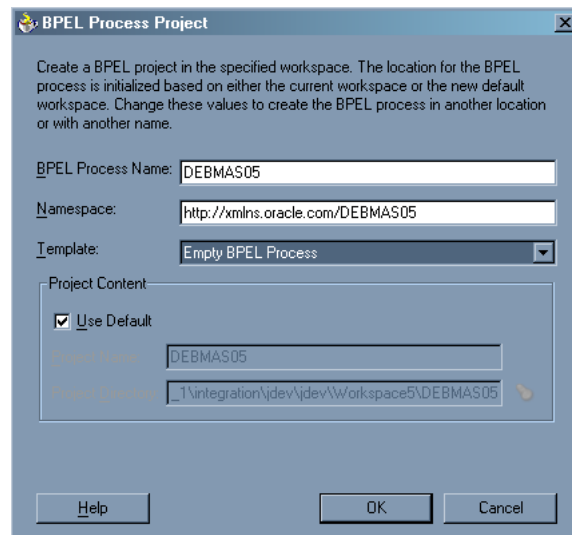

2. Right-click the workspace and select **New Project**.

The New Gallery window is displayed.

3. From the Items list, select **BPEL Process Project** and click **OK**.

The BPEL Process Project dialog box is displayed.

4. Perform the following steps:

- a. Specify a name for the process.

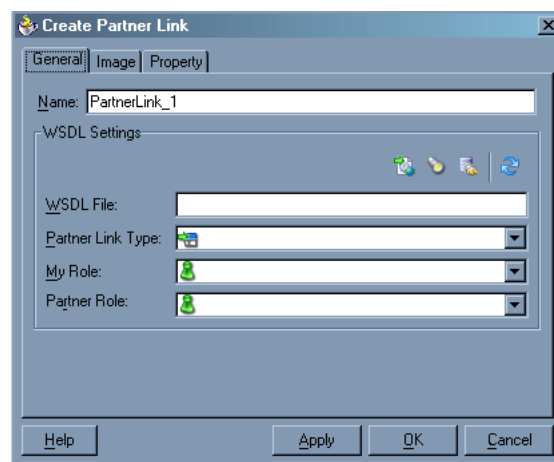

The Namespace field is updated automatically.

- b. From the Template drop-down list, select **Empty BPEL Process**.

- c. Click **OK**.

5. From the Process Activities pane on the right, drag and drop a **PartnerLink** to the visual editor.

The Create Partner Link dialog box is displayed.

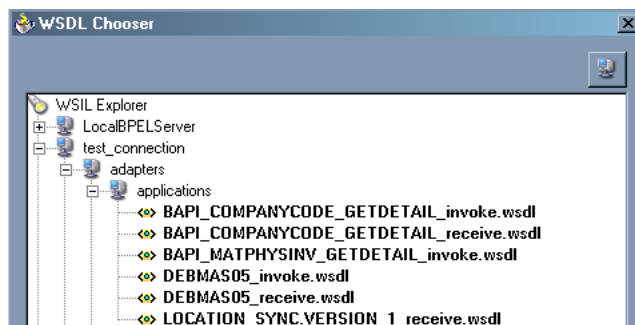

6. Click the **WSIL browser** icon (second icon from the left the **WSDL File** field).

The WSDL Chooser dialog box is displayed.

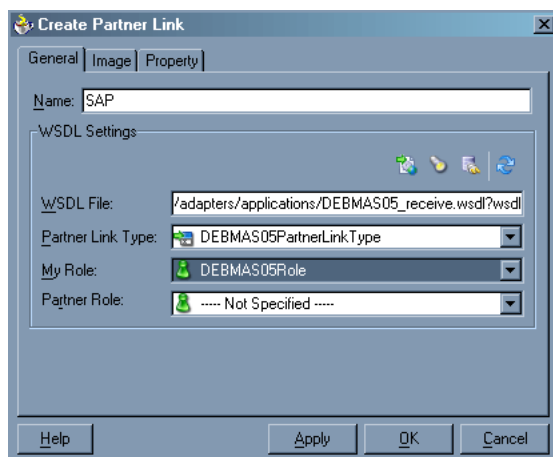

7. Expand your BPEL Server connection, then expand **adapters**, and then **applications**.

The WSDL Chooser dialog box is displayed.

8. Select **DEBMAS05_receive.wsdl** and click **OK**.

The Create Partner Link dialog box is displayed.

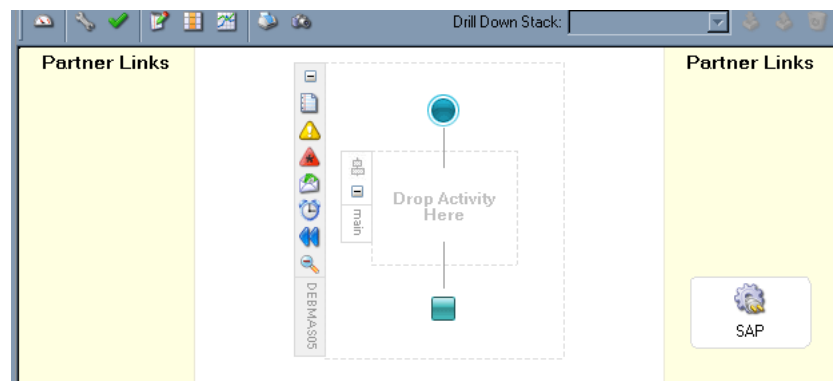

The **WSDL File** field displays the name and location of the selected WSDL file.
The **Partner Link Type** field specifies the PartnerLink defined in the WSDL file.

Perform the following steps:

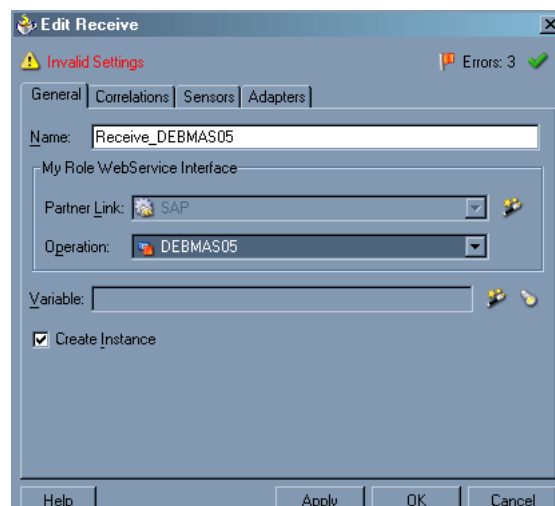

- a. From the **My Role** drop-down list, select the default value **DEBMAS05Role**.
 - b. Leave the **Partner Role** field unspecified.
9. Click **Apply**, and then **OK**.

The new SAP PartnerLink appears in the visual editor.

10. From the **Process Activities** pane on the right, drag a **Receive** activity to the visual editor and place it in the designated placeholder labeled **Drop Activity Here**.
11. Connect the Receive activity to the SAP PartnerLink.

The Edit Receive dialog box is displayed.

Perform the following steps:

- a. Specify a name for the Receive Activity, for example, **Receive_DEBMSAS05**.
 - b. Click the first icon to the right of the **Variable** field, then click **OK** in the Create Variable dialog box that is displayed.
 - c. Verify that the **Create Instance** check box is selected.
12. Click **Apply**.
- The Receive dialog box should no longer display any warnings or errors.
13. Click **OK**.
 14. Select **Save** from the **File** menu.

Deploying the BPEL Process for the SAP_DEBMSAS05 Inbound Service

1. Right-click your process flow in the Applications - Navigator pane.

2. Select **Deploy > Your BPEL PM Server connection > Deploy to default domain.**
 3. When prompted, enter your BPEL Process Manager password and click **OK.**
- The deployment process starts automatically after you enter the correct password.

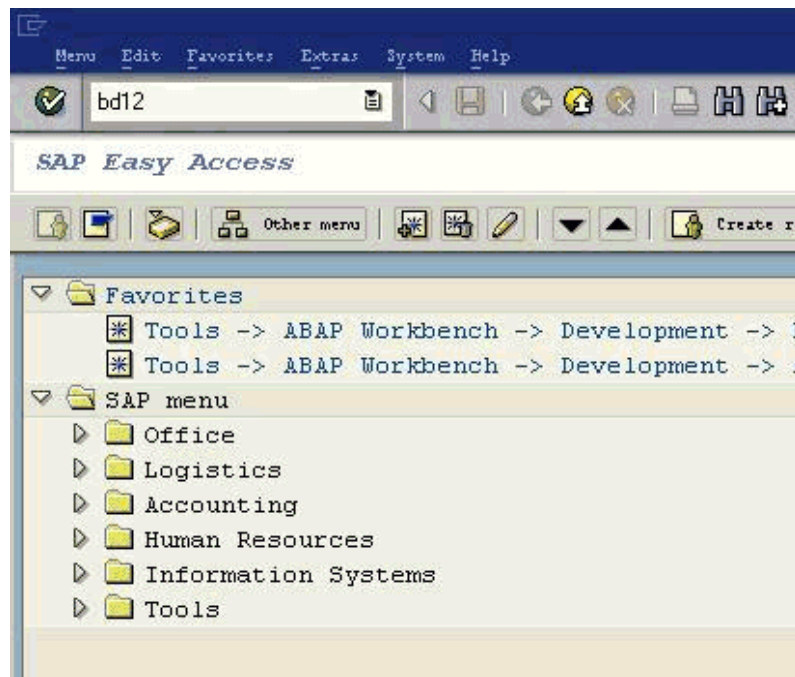

Runtime

Triggering an Event in SAP

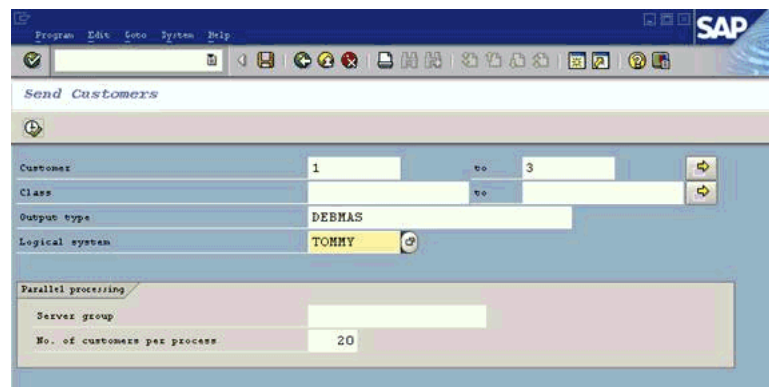

The following topic describes how to trigger an event in SAP to verify event integration using OracleAS Adapter for SAP.

To trigger an event in SAP:

1. Start the SAP Workbench and log in to the SAP system.

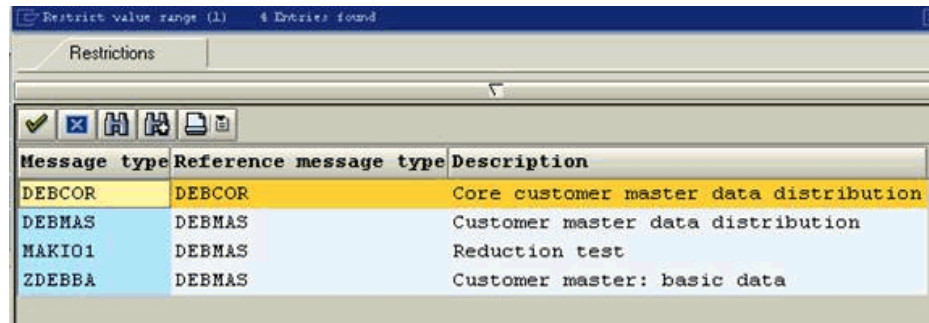

2. Execute the **bd12** transaction.

Enter the following information in the Send Customers window:

- a. In the Customer field, enter a customer number with a range from 1 to 3.
 - b. In the Output type field, enter **DEBMAS**.
 - c. In the Logical system field, specify the logical system you are using with SAP.
3. Click the **check mark** icon in the upper left-hand corner.

Message type	Reference message type	Description
DEBCOR	DEBCOR	Core customer master data distribution
DEBMAS	DEBMAS	Customer master data distribution
MAKIO1	DEBMAS	Reduction test
ZDEBBA	DEBMAS	Customer master: basic data

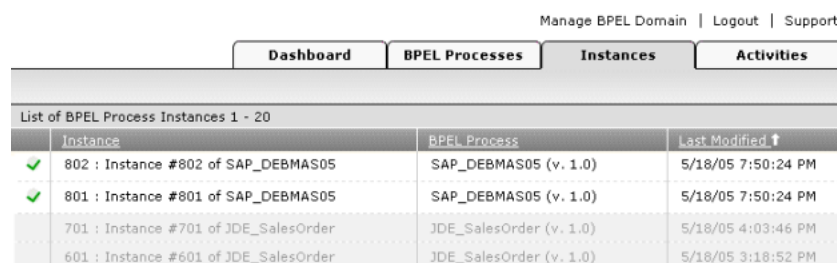

4. Ensure **DEBMAS** appears in the Message type column.
5. Click the **Execute** button.

Customer master data is sent to the logical system specified. If a channel in Application Explorer defined the Program ID with the same value, the channel receives this customer master data from SAP.

Verifying the Results

To verify your results:

1. Log in to Oracle BPEL Console at
`http://host:port/BPELConsole`
2. Enter the password for your BPEL domain.
The default password is `bpel`.
3. Click the **Instances** tab.
Recently received runtime events are displayed in the Instances tab.

Manage BPEL Domain Logout Support

SAP Service Integration

This topic illustrates SAP service integration. The procedures describe design time and runtime.

Design Time

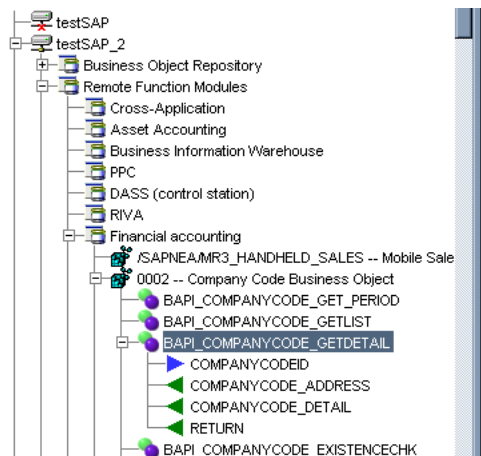

Creating a Request-Response J2CA Service in Application Explorer

Before you design a process for SAP service integration, you must generate its respective WSDL file using Application Explorer.

To generate WSDL in Application Explorer:

- Start **Application Explorer** and connect to a defined SAP target or create a new target.
See [Connecting to SAP](#) on page 2-10 for more information.
- Expand the SAP target to which you are connected.
- Expand **Remote Function Modules > Financial Accounting > 0002 -- Company Code Business Object > BAPI_COMPANYCODE_GETDETAIL**.

The following image shows a connected and expanded target.

4. Right-click the **BAPI_COMPANYCODE_GETDETAIL** node.

The following menu is displayed:

5. Click **Create Outbound JCA Service (Request/Response)**.

The Export WSDL dialog box is displayed.

6. Click **OK**.

You are ready to design a BPEL process in JDeveloper.

Creating a BPEL PM Server Connection

Before you design an outbound BPEL process, you must create a connection to your BPEL Server using JDeveloper. See [Creating a BPEL PM Server Connection](#) on page 5-6 for details on how to create the connection.

Creating a BPEL Project for a Synchronous BPEL Process

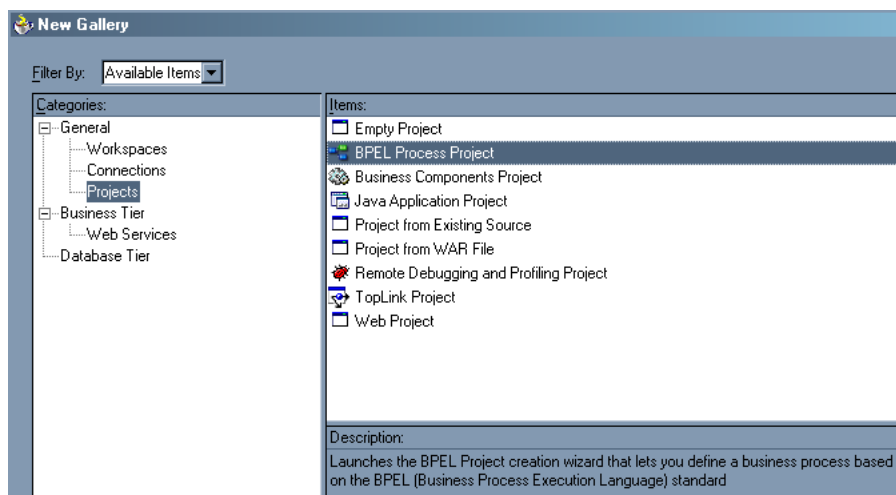

To create a BPEL Project for a synchronous BPEL process:

1. At the bottom of the upper left pane, click the **Applications** tab and select a workspace for your project.

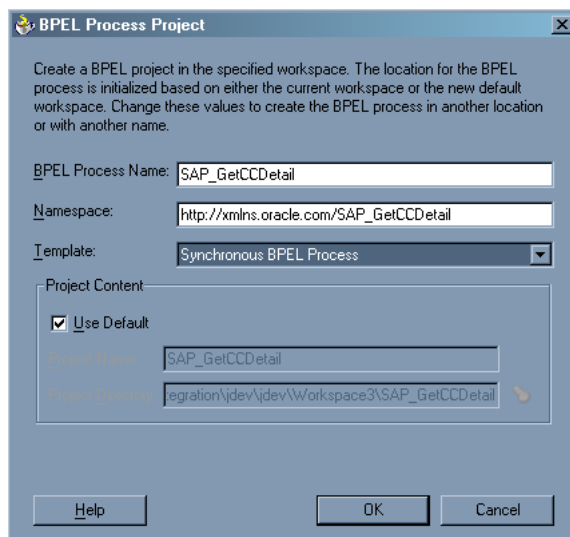

2. Right-click the workspace and select **New Project**.

The New Gallery window is displayed.

3. From the Items list, select **BPEL Process Project** and click **OK**.

The BPEL Process Project dialog box is displayed.

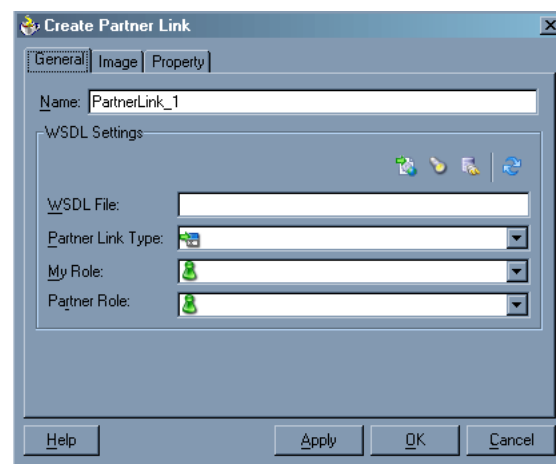

4. Perform the following steps:
 - a. Specify a name for the BPEL process, for example, **SAP_GetCCDetail**.
The Namespace field is updated automatically.
 - b. From the Template drop-down list, select **Synchronous BPEL Process**.
5. Click **OK**.

Designing the BPEL Process for the **BAPI_COMPANYCODE_GETDETAIL** Outbound Service

To design the BPEL Process:

1. From the Process Activities pane on the right, drag and drop a **PartnerLink** to the visual editor.

The Create Partner Link dialog box is displayed.

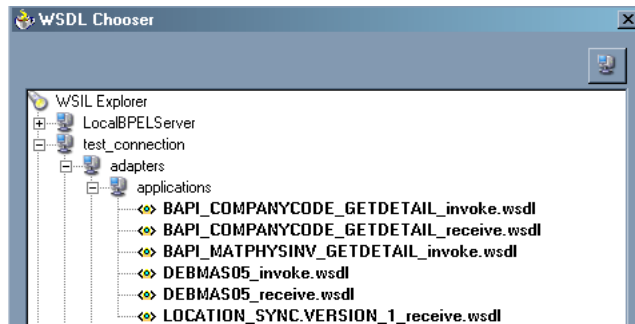

2. Click the **WSIL browser** icon (second icon from the left the **WSDL File** field).

The WSDL Chooser dialog box is displayed.

3. Expand your new server connection, then expand **adapters**, and then **applications**.

The WSDL Chooser dialog box is displayed.

4. Select **BAPI_COMPANYCODE_GETDETAIL_invoke.wsdl** and click **OK**.

The **WSDL File** field in the Create Partner Link dialog box displays the name and location of the selected WSDL file. The **Partner Link Type** field specifies the PartnerLink defined in the WSDL file.

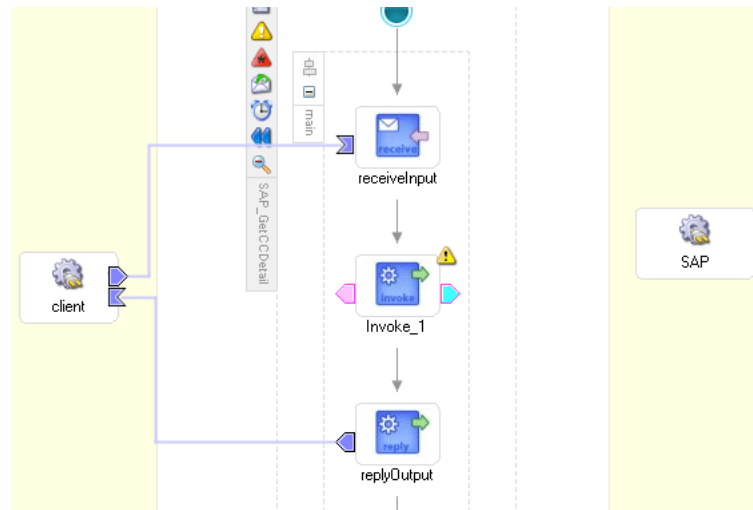

Perform the following steps:

- a. Leave the **My Role** field unspecified. The role of the PartnerLink is null, as it will be synchronously invoked from the BPEL process.
 - b. From the **Partner Role** drop-down list, select the default value **BAPI_COMPANYCODE_GETDETAILRole**. This is the role of the BPEL process.
5. Click **OK**.

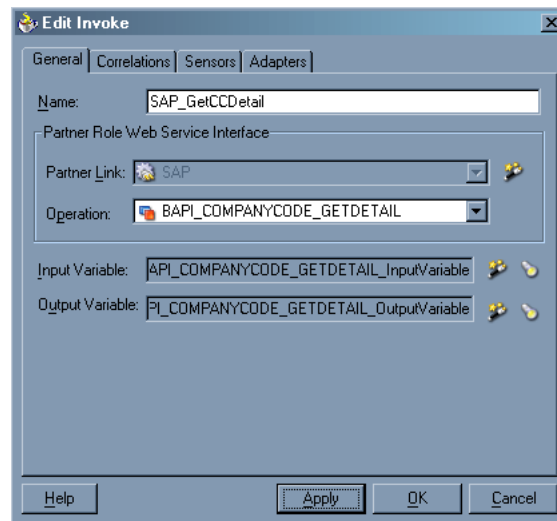

The new PartnerLink appears in the visual editor.

6. Select **Save** from the File menu.
7. From the **Process Activities** pane on the right, drag an **Invoke** activity to the visual editor and place it between the Receive activity (`receiveInput`) and the Reply activity (`replyOutput`).

The Invoke process activity is shown in the diagram view.

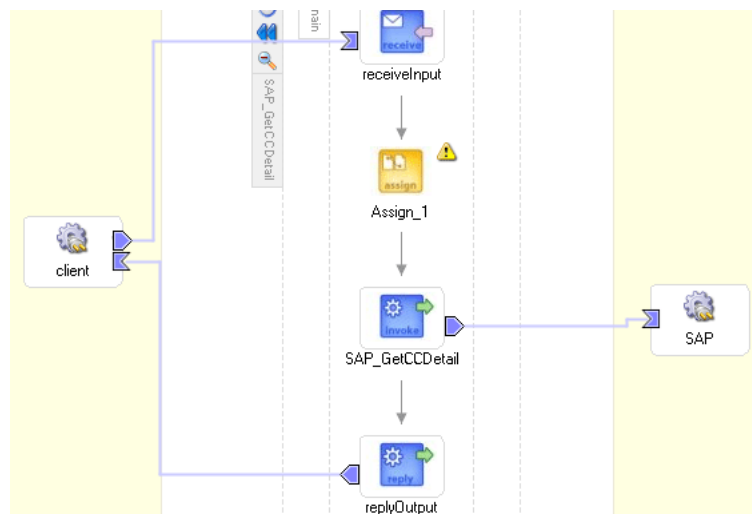

8. Drag the **blue arrow** from Invoke_1 and connect it to the SAP PartnerLink.
The Edit Invoke dialog box is displayed.

Perform the following steps:

- a. In the **Name** field, enter Get_CCDetail.
 - b. Click the first icon to the right of the **Input Variable** field, then click **OK** in the Create Variable window that is displayed.
 - c. Repeat the previous step to create a default variable for Output Variable.
9. Click **OK**.
 10. Drag an Assign process activity and drop it between receiveInput and Get_CCDetail.

The following image shows the new Assign activity in JDeveloper visual editor.

11. Double-click the **Assign** activity icon.

The Assign dialog box is displayed.

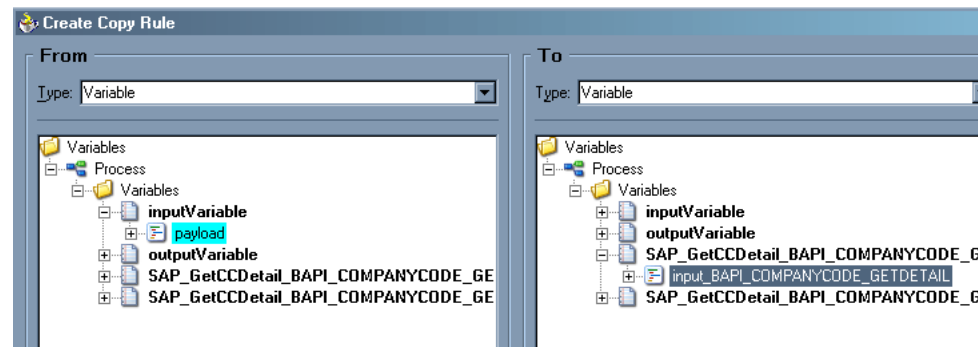

12. In the Copy Rules tab, click **Create**.

The Create Copy Rule dialog box is displayed.

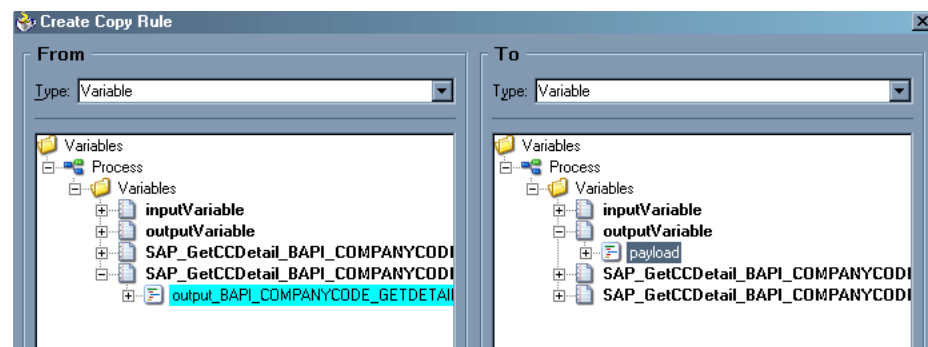

- a. In the **From** pane, expand **Variables**, then **inputVariable**, and then highlight **payload**.
- b. In the **To** pane, expand **Variables**, then **GetCompanyDetail_BAPI_COMPANYCODE_GETDETAIL_InputVariable**, and then highlight **input_BAPI_COMPANYCODE_GETDETAIL**.

Your Create Copy Rule dialog box should look as follows:

13. To close the Create Copy Rule dialog box and the Assign dialog box, click **OK**.
14. From the **Process Activities** pane on the right, drag another **Assign** activity to the visual editor and place it between the Invoke activity (SAP_GetCCDetail) and the Reply activity (replyOutput).
15. Double-click the **Assign** activity icon and click **Create**.
16. Map **Get_CCDetail_BAPI_COMPANYCODE_GETDETAIL_OutputVariable > output_BAPI_COPMANYCODE_GETDETAIL** to **outputVariable > payload**.

Verify that you have mapped all variables as follows:

17. Click **OK**, then click **OK** again.
18. Select **Save** from the File menu.

You have completed the design of your BPEL process.

Deploying the BPEL Process for the BAPI_COMPANYCODE_GETDETAIL Outbound Service

JDeveloper deploys the outbound BPEL process for BAPI_COMPANYCODE_GETDETAIL directly to Oracle BPEL Console.

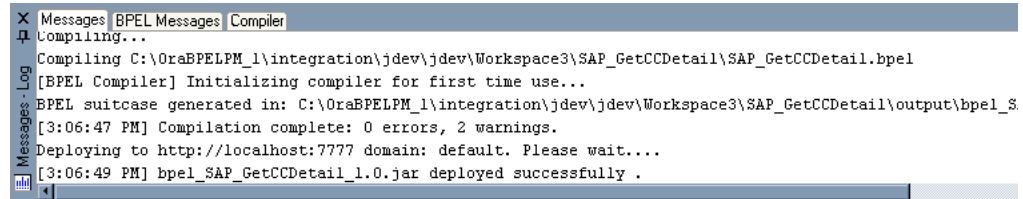

To deploy your BPEL process in JDeveloper:

1. Right-click your process flow in the Applications - Navigator pane.
2. Select **Deploy > Your BPEL PM Server connection > Deploy to default domain**.
The Password Prompt dialog box is displayed.
3. Enter your BPEL Process Manager password in the Password Prompt dialog box.

The deployment process starts automatically after you enter the correct password.

4. Observe the **Messages** log on the bottom of the window.

The Messages log displays the deployment status. In this example, it shows a successful deployment message for the process.

```

X Messages | BPEL Messages | Compiler
Compiling...
Compiling C:\OraBPELPM_1\integration\jdev\jdev\Workspace3\SAP_GetCCDetail\SAP_GetCCDetail.bpel
[BPEL Compiler] Initializing compiler for first time use...
BPEL suitcase generated in: C:\OraBPELPM_1\integration\jdev\jdev\Workspace3\SAP_GetCCDetail\output\bpel_3
[3:06:47 PM] Compilation complete: 0 errors, 2 warnings.
Deploying to http://localhost:7777 domain: default. Please wait....
[3:06:49 PM] bpel_SAP_GetCCDetail_1.0.jar deployed successfully .
  
```

If deployment was not successful, click the **Compiler** tab to view all error and warning messages generated during the deployment process.

Runtime

To invoke the BAPI_COMPANYCODE_GETDETAIL process from Oracle BPEL Console:

1. Start the Oracle BPEL Console by entering the following URL in a browser:

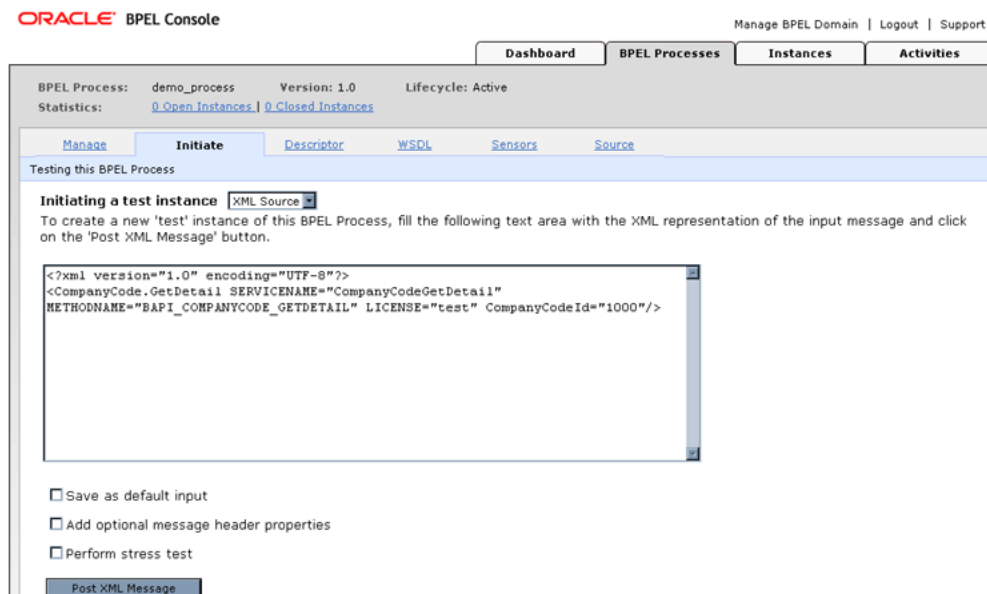

`http://host:port/BPELConsole`

2. Select a domain and provide a valid password.

The Oracle BPEL Console main page is displayed.

3. Click the **BPEL Processes** tab.
4. Click the SAP process link, **BAPI_COMPANYCODE_GETDETAIL**.
5. Click **Initiate**.

The Initiate tab enables you to test your BPEL process.

Perform the following steps:

- a. From the **Initiating a test instance** drop-down menu, select **XML Source**.
- b. Enter the following code in the text area provided for XML input:

```
<?xml version="1.0" encoding="UTF-8"?>
<CompanyCode.GetDetail SERVICENAME="CompanyCodeGetDetail" METHODNAME="BAPI_
COMPANYCODE_GETDETAIL" LICENSE="test" CompanyCodeId="1000"/>
```

6. Click **Post XML Message**.

The response received from the SAP system is displayed in the Initiate window.

InterConnect Integration Examples

This chapter contains the following examples:

- [Creating Events](#)
- [SAP Event Integration](#)
- [SAP Service Integration](#)

The event and service scenarios shown depend on the following prerequisites and configuration steps:

Prerequisites

- OracleAS Adapter for SAP installed on the Oracle Application Server.
- OracleAS Database adapter deployed and configured.
- OracleAS Integration InterConnect Adapter Plugin for EIS installed and running.

See Also: *Oracle Application Server Adapters Installation Guide*

Configuration Steps

The examples present all the configuration steps necessary for demonstrating service and event integration with SAP. See the following for more information:

1. Configure SAP for outbound processing. See [Appendix A, "Configuring SAP for Inbound and Outbound Processing"](#) for more information.
2. Configure the OracleAS Adapter for SAP for services and events. See [Chapter 2, "Configuring OracleAS Adapter for SAP"](#) for more information.
3. Configure OracleAS Integration InterConnect iStudio for service and event interactions. For more information, see the service and event steps that follow.

Creating Events

The following example describes how to create events for DEBMAS05 and how to create a channel and a port.

1. Open Application Explorer.
2. Expand the **Adapters** node.

Perform the following steps:

- a. Expand the **SAP** node.
- b. Click the target name, for example, SAPTarget, under the **SAP** node.

The Connection dialog box opens, populated with values you entered.

3. Verify your connection parameters. If required, provide the password.
4. Right-click the target name and select **Connect**.

The x icon disappears, indicating that the node is connected.

5. Expand the **ALE(IDOCS)** node and select **DEBMAS**.

6. Expand the **DEBMAS** list and select **DEBMAS05**.

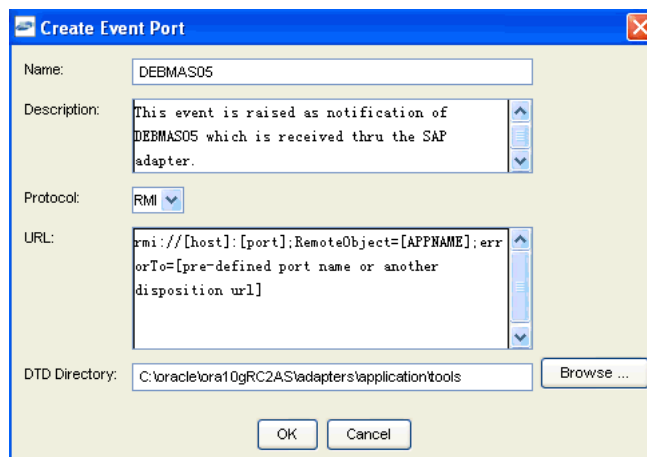

Creating Events for DEBMAS05

To create events for DEBMAS05:

1. Right-click the **DEBMAS05** node and select **Create Event Port**.

The Create Event Port dialog box is displayed.

Perform the following steps:

- a. Type a name for the event port and provide a brief description.
 - b. From the list, select the required disposition, for example, RMI.
 - c. Type the disposition URL.
 - d. Type (or browse to) the path containing the DTD directory.
2. Click **OK**.

The port appears under the ports node in the left pane.

In the right pane, a table appears that summarizes the information associated with the event port you created.

Detail	
Name	Value
Name	DEBMA05
Description	This event is raised as notification
Disposition	rmi://waylab1;RemoteObject=SAPF
Content	http://Lee.ibm.com:7777/lbse/IBSESe

You can now associate the event port with a channel.

Creating a Channel

To create a channel:

1. In the left pane, click the **Events** node.
2. Expand the **SAP** node.

The ports and channels nodes appear in the left pane.

3. Right-click **Channels** and select **Add Channel**.

The Add Channel dialog box opens.

Perform the following steps:

- a. Type a name for the channel, for example, TEST_CHANNEL.
 - b. Type a brief description.
 - c. From the **Protocol** list, select **SAP Channel**.
 - d. Select an event port from the list of available ports. To select more than one, hold down the **Ctrl** key and click the ports.
 - e. To transfer the ports to the list of selected ports, click the **double right (>>)** arrow button.
4. Click **Next**.

The Application Server dialog box opens.

The following tabs are available:

- System (Required)
- User (Required)
- Advanced

5. For the **System** tab, type the appropriate information for your SAP channel, based on the information in the following table.

Table 6–1 System Tab Parameters

Target Parameter	Description
Gateway host	A host name for the SAP Gateway.
Gateway service	A service for the SAP Gateway.
Program ID of the server	An SAP program ID you want to use for this channel.
Application Server	A host name for the application server.
System number	A system number for SAP.

6. Click the **User** tab.

7. For the **User** tab, type the appropriate information for your SAP channel, based on the information in the following table.

Table 6–2 User Tab Parameters

Target Parameter	Description
Client	The client number defined for the SAP application for client communications.
User	A valid user ID for the SAP application.
Password	A valid password for the SAP application.
Language	A language key. EN (English) is the default.
Code page	A character code page value.

8. For the **Advanced** tab (optional), type the appropriate information for your SAP channel, based on the information in the following table.

Table 6–3 Advanced Tab Parameters

Target Parameter	Description
IDoc Format	Select an IDoc type from the list.
User Defined Function Modules	Enter the path to the user-defined function module you created.
SAP trace	Select this check box if you want to enable SAP traces for troubleshooting purposes.

Table 6–3 (Cont.) Advanced Tab Parameters

Target Parameter	Description
Unicode	Select this check box if you are expecting your response in Unicode format.
Synchronous Processing	Select the type of synchronous processing from the list.

9. Click OK.

The channel appears under the channels node in the left pane.

An X over the icon indicates that the channel is currently disconnected. You must start the channel to activate your event configuration.

**10. Right-click the channel node and select Start.**

The channel you created becomes active.

The X that was over the icon in the left pane disappears.

11. To stop the channel, right-click the connected channel node and select Stop.

SAP Event Integration

This topic illustrates how OracleAS Adapter for SAP integrates with SAP to receive event data. The procedures describe design time and runtime. The example demonstrates how OracleAS Adapter for SAP integrates with SAP to receive event data. In this example, an SAP event occurs when a customer record is added to an SAP system. The adapter receives the SAP event customer data and disposes the data to an RMI event port. The RMI server resides on the OracleAS Integration InterConnect Hub. An OracleAS Database adapter on the OracleAS Integration InterConnect Hub subscribed to this event receives the customer data, transforms the event data, and then inserts the data into a database table. The design time and runtime procedures are outlined in the following sections.

OracleAS Integration InterConnect Design Time

The following procedures describe how to start the repository and create a common view and then publish and subscribe an event.

Starting the Repository

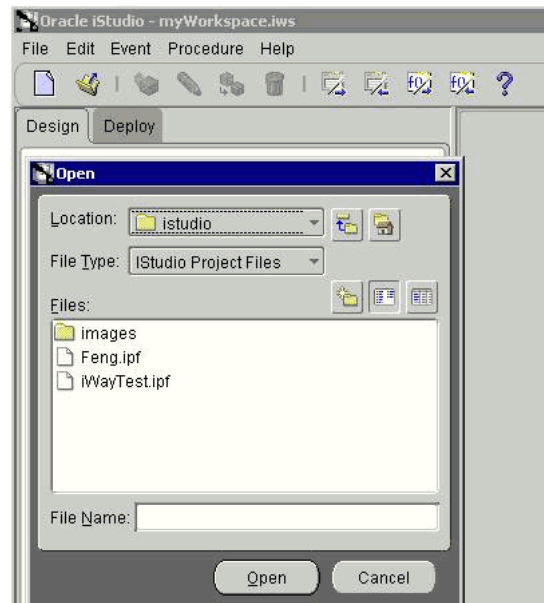

To start the repository, double-click the `start.bat` file located in the following directory:

```
D:\oracle\ora92InterCon\oai\9.0.4\repository\start.bat
```

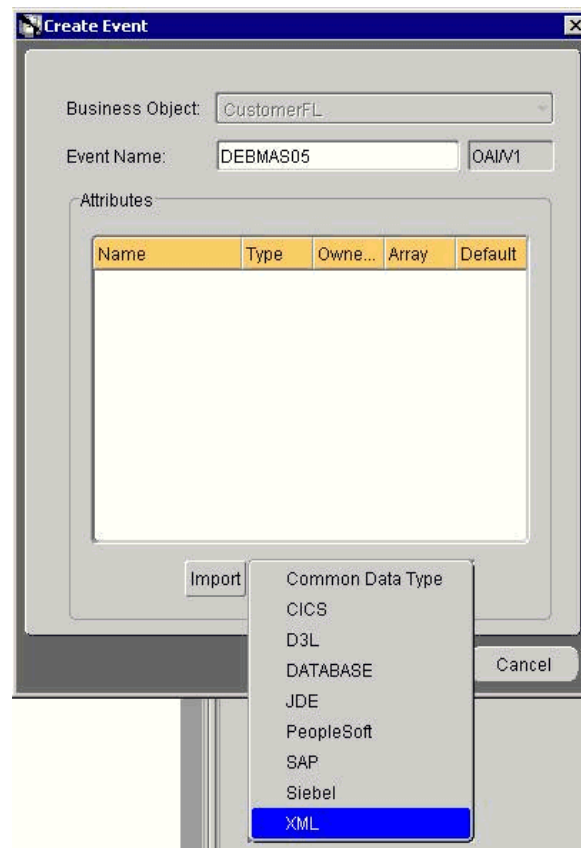

Creating a Common View

To create a Common View:

1. Start Oracle iStudio.

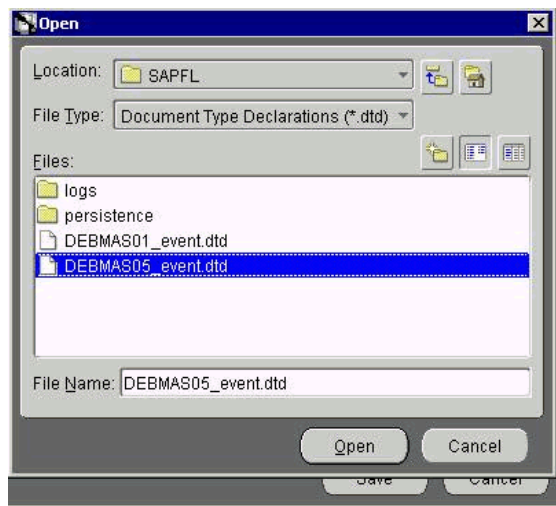

2. Open a new project.
3. Open **Common Views** and **Business Objects**.
4. Create a Business Object called **CustomerFL** and a new event under CustomerFL.

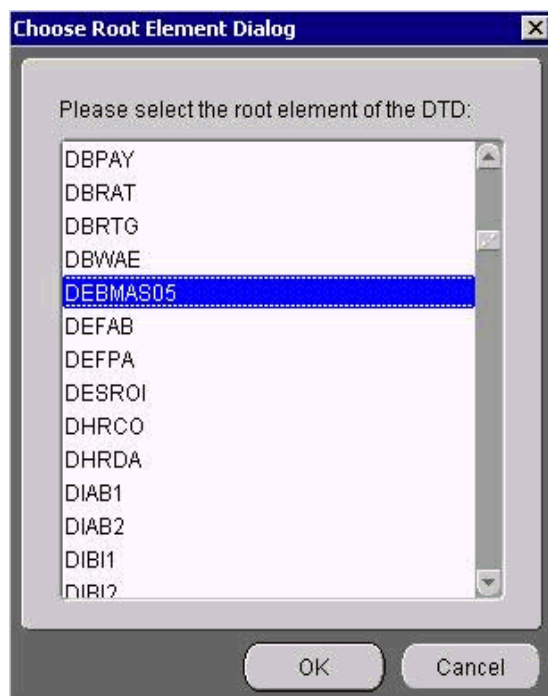

Note: The event name must be the root element of the DTD generated from Application Explorer. In this example, the root element in the DTD is DEBMAS05.

5. Click **Import** and select **XML** from the list.

6. Open the DTD generated from Application Explorer.

7. Select the root element, which must be identical to the event name specified earlier.

Name	Type	OwnerVersi...	Array	Default
DEBMAS05	DEBMAS05	OAI/V1	<input type="checkbox"/>	NULL
tid	String		<input type="checkbox"/>	NULL
IDOC	IDOC_5	OAI/V1	<input checked="" type="checkbox"/>	NULL
BEGIN	String		<input type="checkbox"/>	NULL
EDI_DC40	EDI_DC40_5	OAI/V1	<input type="checkbox"/>	NULL
E1KNA1M	E1KNA1M_3	OAI/V1	<input type="checkbox"/>	NULL
SEGMENT	String		<input type="checkbox"/>	NULL
MSGFN	String		<input type="checkbox"/>	NULL
KUNNR	String		<input type="checkbox"/>	NULL
ANRED	String		<input type="checkbox"/>	NULL
AUFSD	String		<input type="checkbox"/>	NULL
PAUNE	String		<input type="checkbox"/>	NULL

8. Click **Save**.

Publishing an Event

To publish an event:

1. Create a new application called **SAPFL**.
2. Expand **SAPFL**.
3. Right-click **Publish Events** and select **New**.

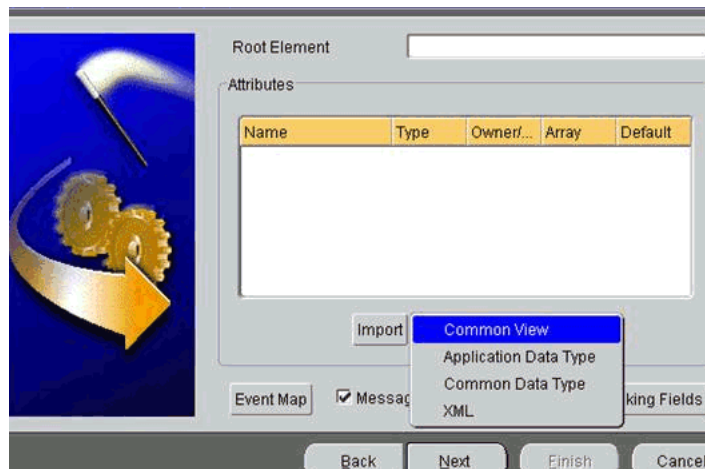

Application: SAPFL
Message Type: XML

Select an Event

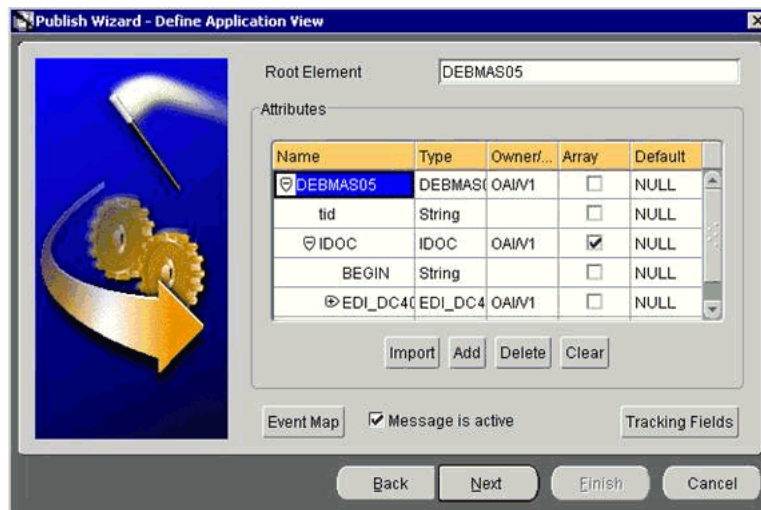

- GetDetailResponse
- GetDetailResponse2
- Gitlin
- demo
- CompanyCodeList
- AC
- CICSDEMO
 - FILEA
- CustomerFL
 - DEBMAS05**
 - NewCustomer
 - CustomerAddFL

4. Select **XML** as the message type and select **DEBMAS05** under the **CustomerFL** business object as the event.

- Click **Next**.

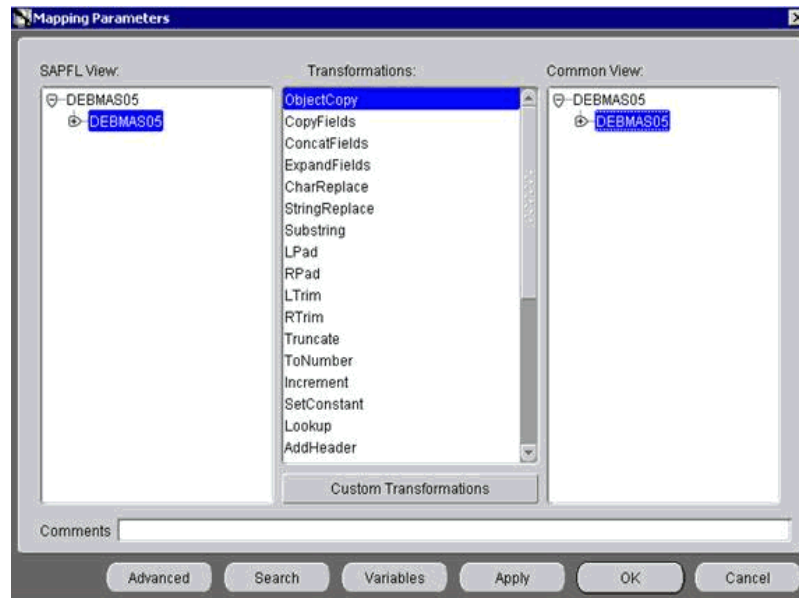

- Click **Import** and select **Common View** from the list.
The structure from the selected Common View loads.

- Ensure you enter the root element of the XML message, for example, DEBMA05.
- Click **Next**.
- Click **New** to create a mapping between the Common View and Application View.

In this example, the Application View and Common View have the same structure. All the attributes can be mapped by using the ObjectCopy transformation.

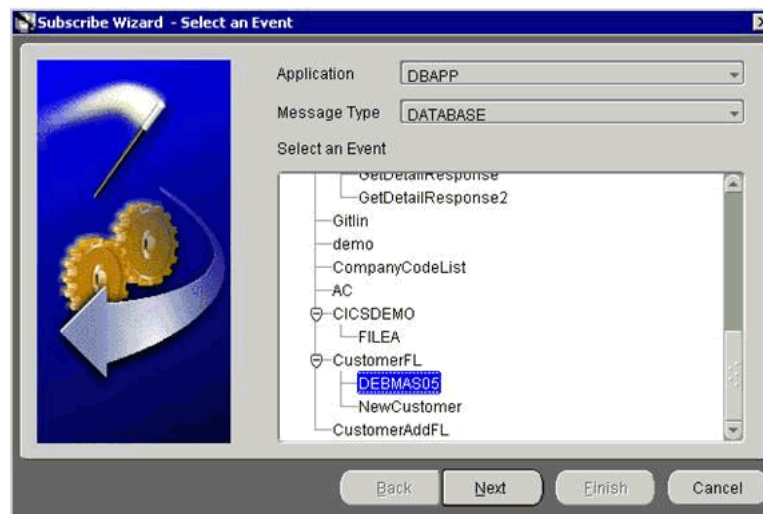

10. Click **Apply**, **OK**, and then **Finish**.

The application definition for a published event is now complete.

Subscribing an Event

To subscribe an event:

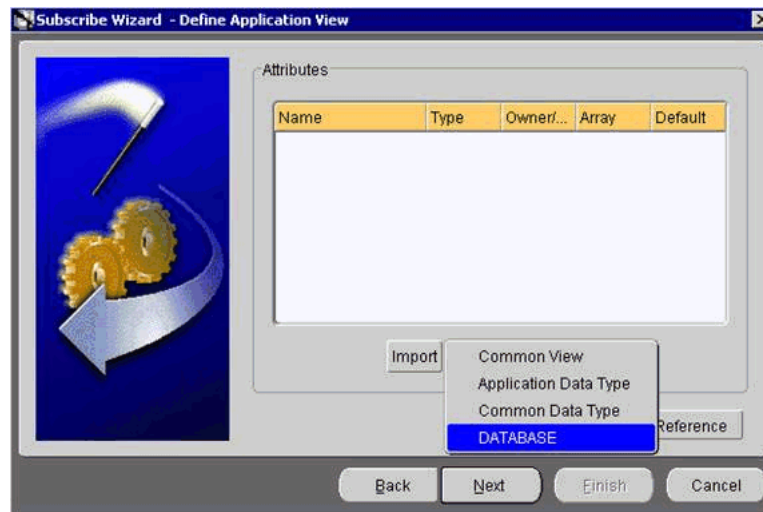

1. Create a new application called **DBAPP**.
2. Expand **DBAPP**.
3. Right-click **Subscribe Events** and select **New**.

Perform the following steps:

- a. Select **Database** as the message type.
- b. Under the **CustomerFL** business object, select **DEBMAS05** as the event.

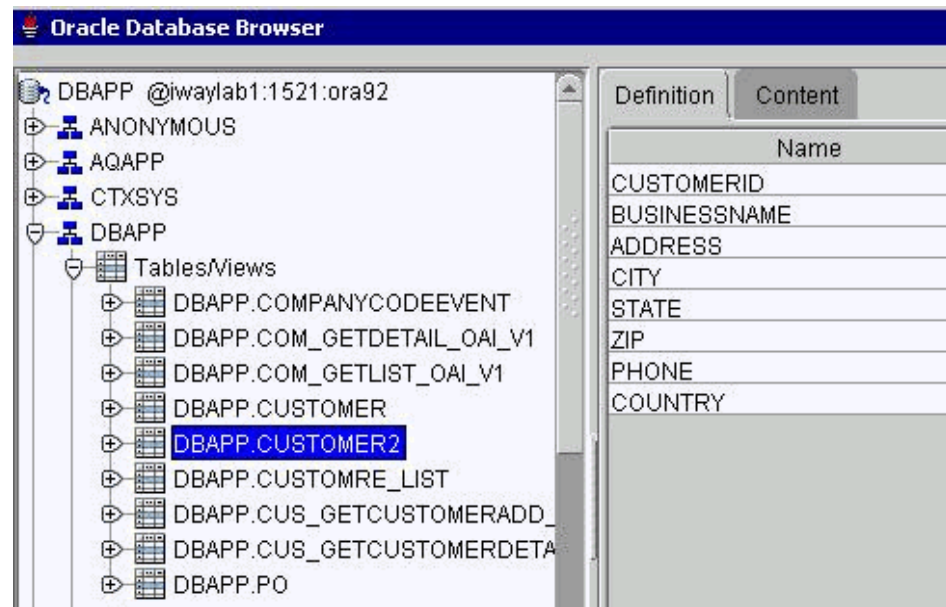

4. Click **Next**.

5. Click **Import** and select **Database** from the list.
The Database Login dialog box is displayed.

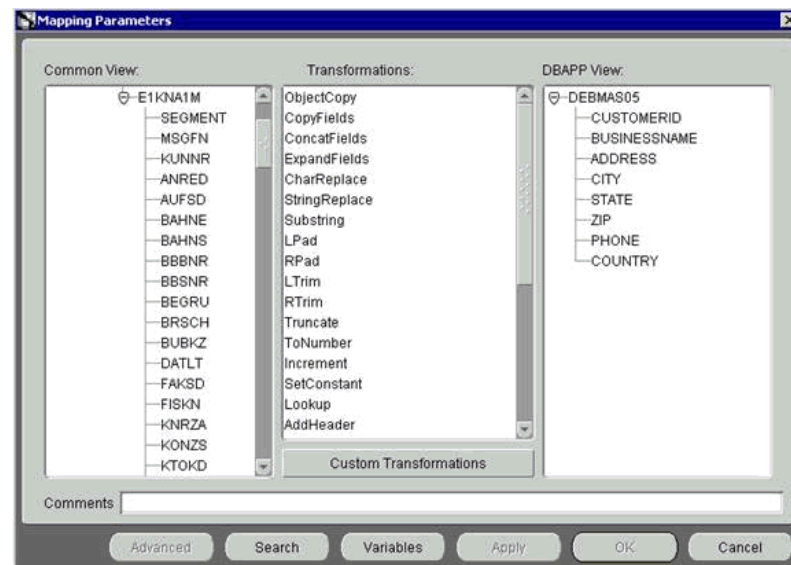

6. Type the appropriate login credentials and click **Login**.

Perform the following steps:

- a. Expand the **DBAPP** schema.
 - b. Select the previously defined table, in this example, **DBAPP.CUSTOMER2**.
7. Click **Next**.
 8. Click **New** to define mapping between the Application View and the Common View.

Perform the following steps:

- a. Define the mapping for each field.
- b. After you map each field, click **Apply**.

9. When you have finished the mapping process, click **OK**.

The SQL code window is displayed.

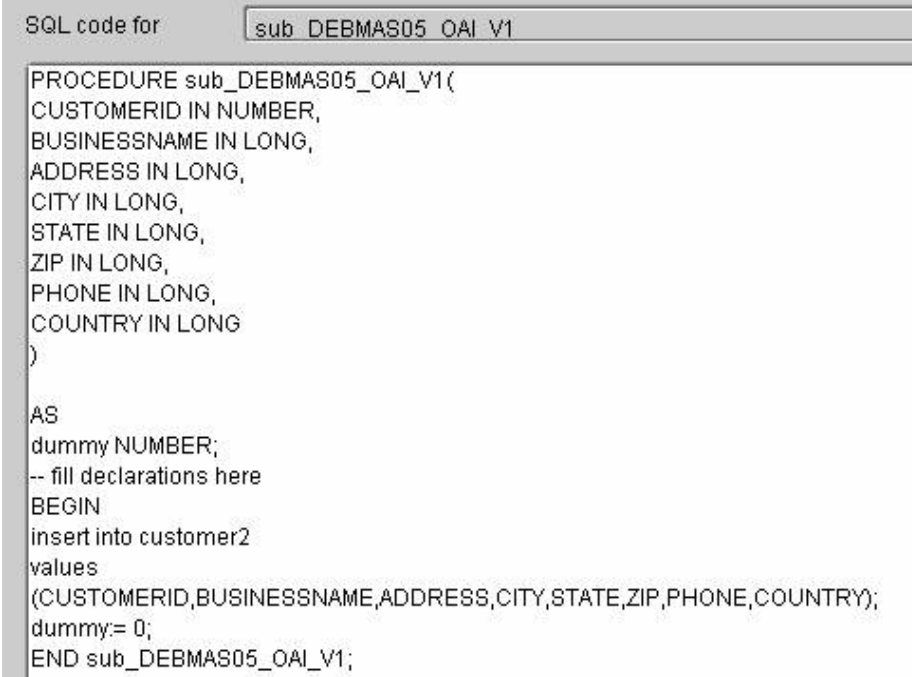

- a. Select **sub_DEBMAS05_OAI_V1** from the **SQL** code list.

The procedure details are displayed.

- b. Enter the appropriate code, if necessary.

In the following example, the INSERT statement is entered between BEGIN and END to insert received event data into the Customer2 table.

This script must be executed to insert event data into the database table.

The screenshot shows a window titled "SQL code for" with a dropdown menu set to "sub_DEBMAS05_OAI_V1". The main text area contains the following SQL code:

```
PROCEDURE sub_DEBMAS05_OAI_V1(  
CUSTOMERID IN NUMBER,  
BUSINESSNAME IN LONG,  
ADDRESS IN LONG,  
CITY IN LONG,  
STATE IN LONG,  
ZIP IN LONG,  
PHONE IN LONG,  
COUNTRY IN LONG  
)  
  
AS  
dummy NUMBER;  
-- fill declarations here  
BEGIN  
insert into customer2  
values  
(CUSTOMERID,BUSINESSNAME,ADDRESS,CITY,STATE,ZIP,PHONE,COUNTRY);  
dummy:= 0;  
END sub_DEBMAS05_OAI_V1;
```

10. Click **Finish**.

The application definition for a subscribed event is now complete.

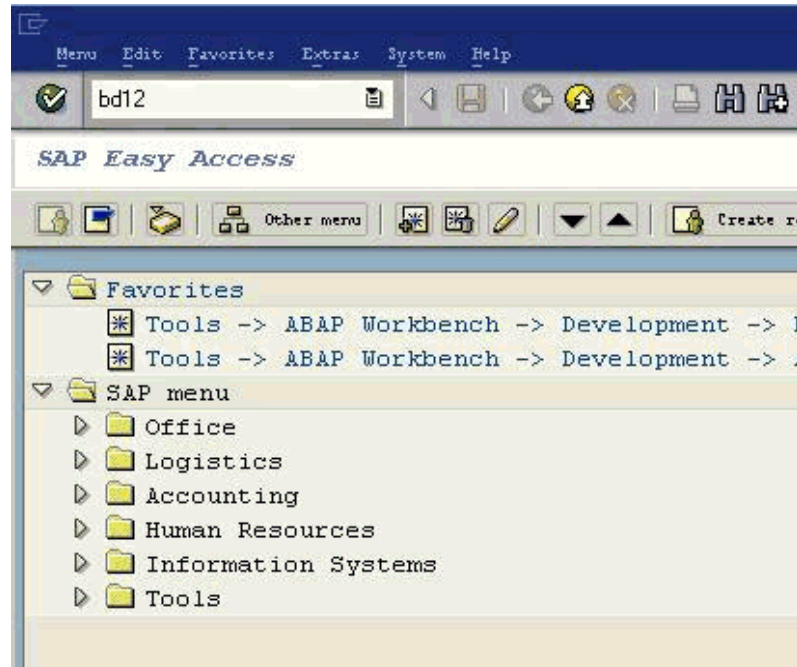

OracleAS Integration InterConnect Runtime

The following topic describes how to trigger an event in SAP to verify event integration using OracleAS Adapter for SAP.

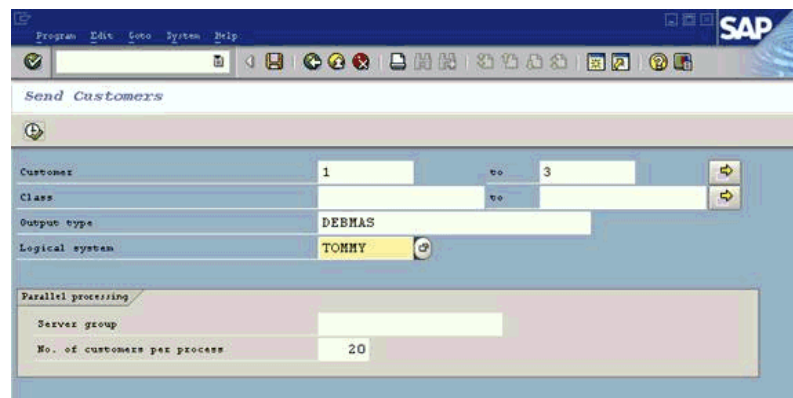

Triggering an Event

To trigger an event in SAP:

1. Start the SAP Workbench and log in to the SAP system.

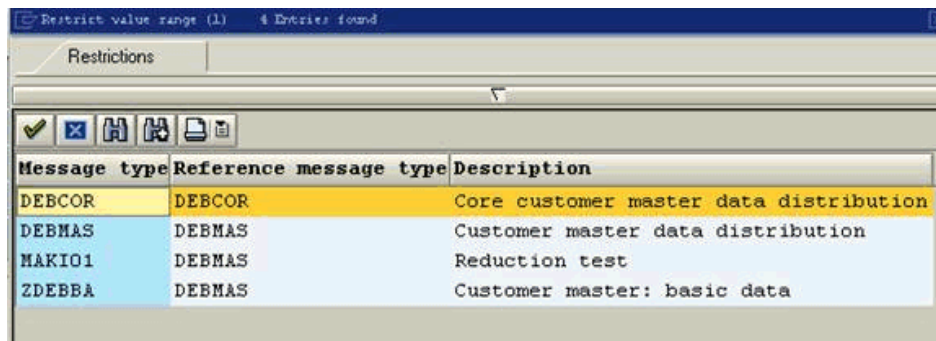

2. Execute the **bd12** transaction.

Perform the following steps:

- a. In the Customer field, enter a customer number with a range from 1 to 3.
- b. In the Output type field, enter **DEBMA**.
- c. In the Logical system field, specify the logical system you are using with SAP.

- Click the **check mark** icon in the upper left-hand corner.

Message type	Reference message type	Description
DEBCOR	DEBCOR	Core customer master data distribution
DEBMAS	DEBMAS	Customer master data distribution
MAKIO1	DEBMAS	Reduction test
ZDEBBA	DEBMAS	Customer master: basic data

- Ensure **DEBMAS** appears in the Message type column.

Customer master data is sent to the logical system specified. If a channel in Application Explorer defined the Program ID with the same value, the channel receives this customer master data from SAP.

SAP Service Integration

This topic illustrates SAP service integration. The procedures describe design time and runtime.

OracleAS Integration InterConnect Design Time

The following procedures describe how to start the repository and create a common view, and then define invoked and implemented procedures. The following also describes how to export PL/SQL code from iStudio.

Starting the Repository

To start the repository, double-click the `start.bat` file located in the following directory:

```
D:\oracle\ora92InterCon\oai\9.0.4\repository\start.bat
```

Creating a Common View

To create a Common View:

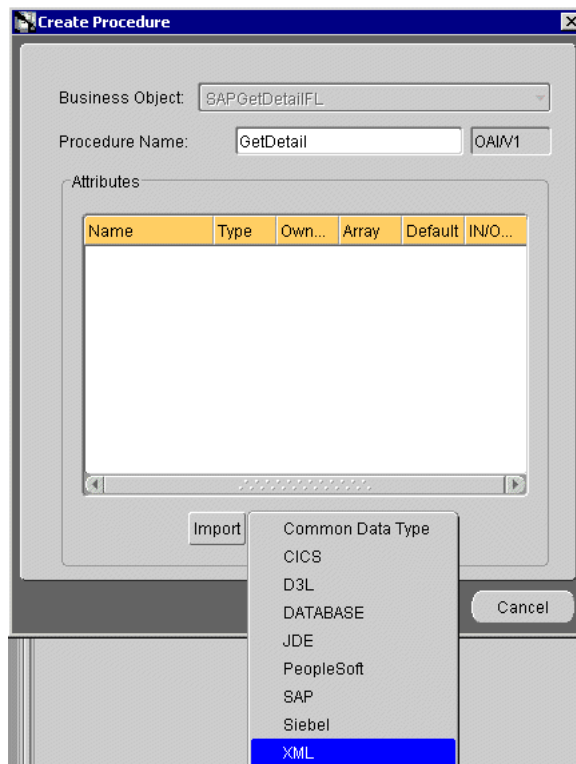

- Start Oracle iStudio by double-clicking the `start.bat` file located in the following directory:

```
D:\oracle\ora92iStudio\oai\9.0.4\istudio\iStudio.bat
```

iStudio is started.

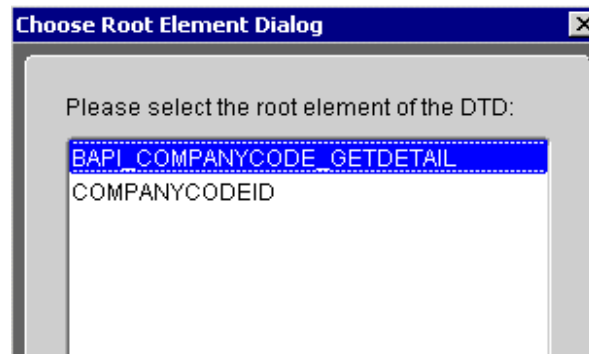

2. Open a project.
3. Open **Common Views** and **Business Objects**.
4. Create a Business Object called **SAPGetDetailFL**.

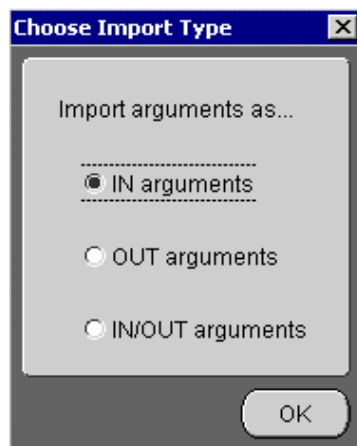

5. Create a new procedure under **SAPGetDetailFL** and type **GetDetail** as the procedure name.
6. Open the DTD generated from Application Explorer and load it.

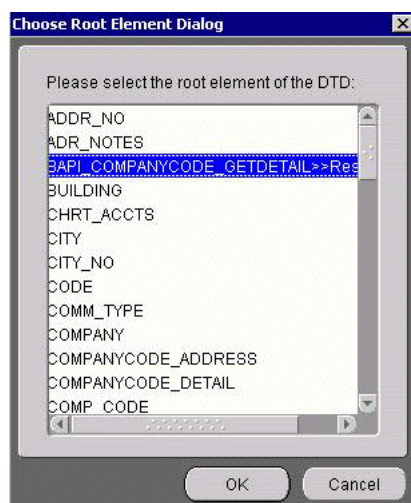

The Choose Root Element dialog box is displayed.

7. Select the root element, `BAPI_COMPANYCODE_GETDETAIL`, for this example.
8. Click **OK**.

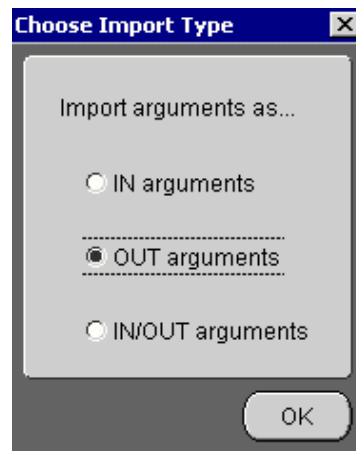

9. Select **IN arguments** as the import type for the request DTD and click **OK**.

10. Import the response DTD, select the root element, and click **OK**.

The Choose Import Type dialog box is displayed.

11. Select **OUT arguments** as the import type for the response DTD and click **OK**.

Business Object		SAPGetDetailFL			
Procedure Name:		GetDetail		Owner/Version: OAI/V1	
Attributes					
Name	Type	O	Array	Default	IN/OUT/INOUT
<input checked="" type="checkbox"/> BAPI_COMPANYCODE_GETDETAIL	BAPI_COMPANYCODE	OAI/V1	<input type="checkbox"/>	NULL	IN
SERVICENAME	String		<input type="checkbox"/>	BAPI_COMPANYCODE_GETDETAIL	IN
METHODNAME	String		<input type="checkbox"/>	BAPI_COMPANYCODE_GETDETAIL	IN
LICENSE	String		<input type="checkbox"/>	test	IN
COMPANYCODEID	String		<input type="checkbox"/>	NULL	IN
BUSINESSNAME	String		<input type="checkbox"/>	NULL	OUT
STREET	String		<input type="checkbox"/>	NULL	OUT
CITY	String		<input type="checkbox"/>	NULL	OUT
STATE	String		<input type="checkbox"/>	NULL	OUT
PHONE	String		<input type="checkbox"/>	NULL	OUT
COUNTRY	String		<input type="checkbox"/>	NULL	OUT

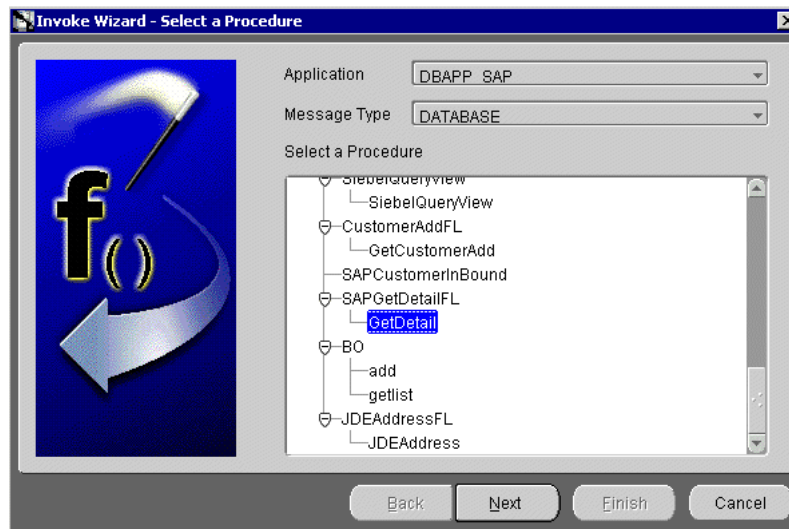

12. Manually enter all the OUT parameters as shown in the previous image.
13. To save the new procedure, click **Save**.

Creating an Invoked Procedure

To create an invoked procedure:

1. Create a new application called **DBAPP_SAP**.
2. Right-click **Invoked Procedures** and select **New**.

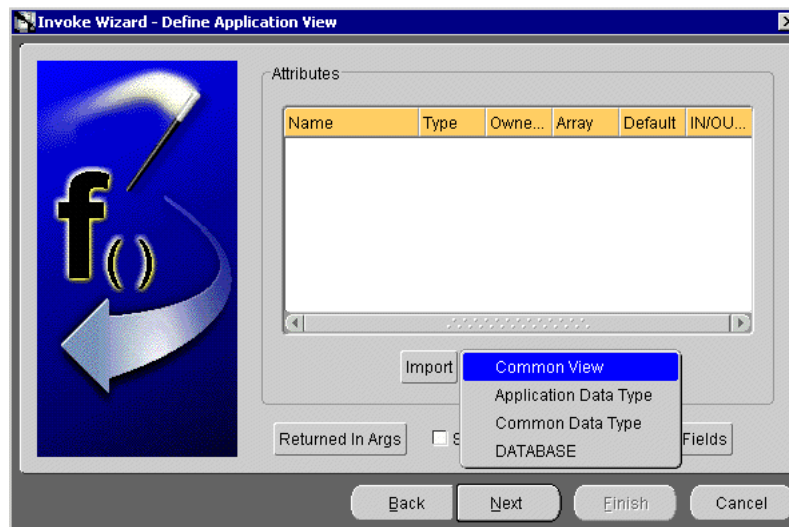

The Invoke Wizard - Select a Procedure window is displayed.

Perform the following steps:

- a. From the **Message Type** list, select **DATABASE**.
 - b. Expand the **SAPGetDetailFL** business object as the event and select **GetDetailFL**.
3. Click **Next**.

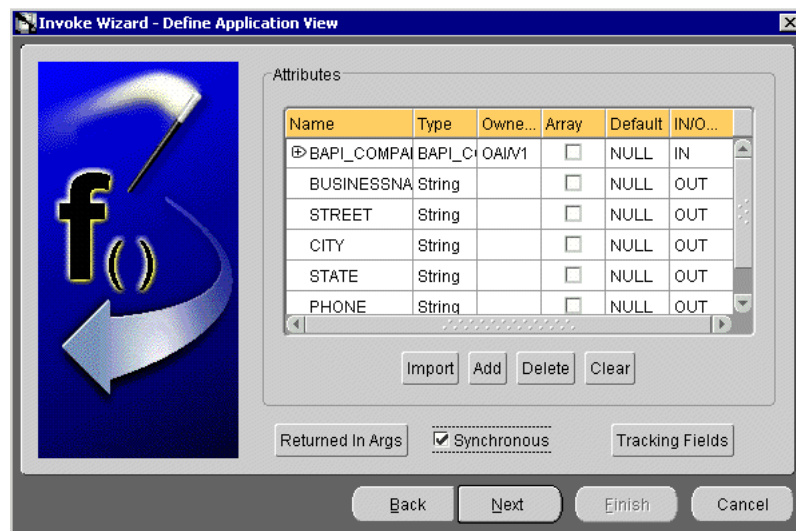

The Invoke Wizard - Define Application View window is displayed.

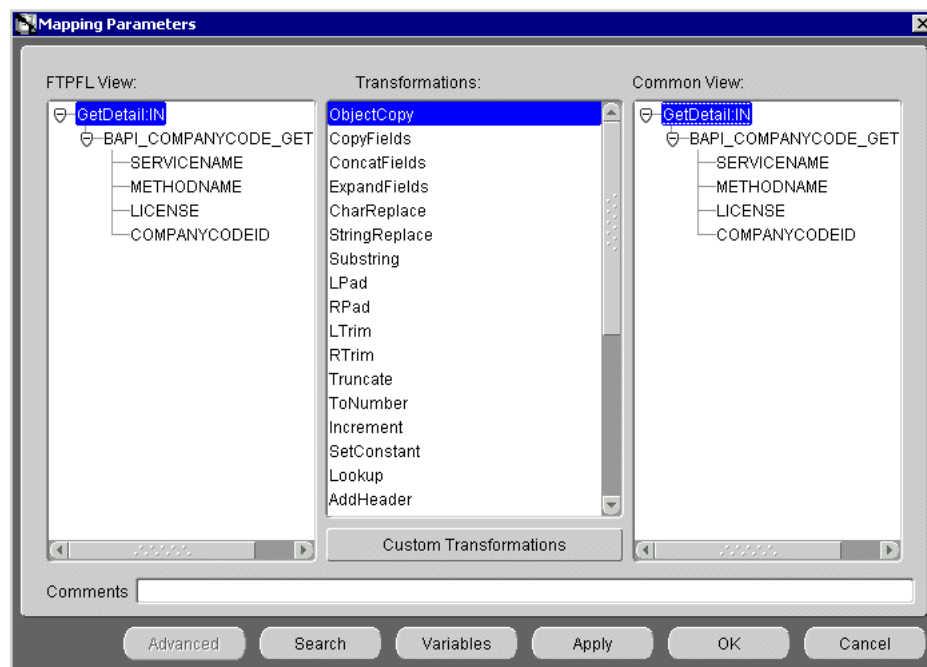

Perform the following steps:

- a. Click **Import**.
- b. Select **Common View**.

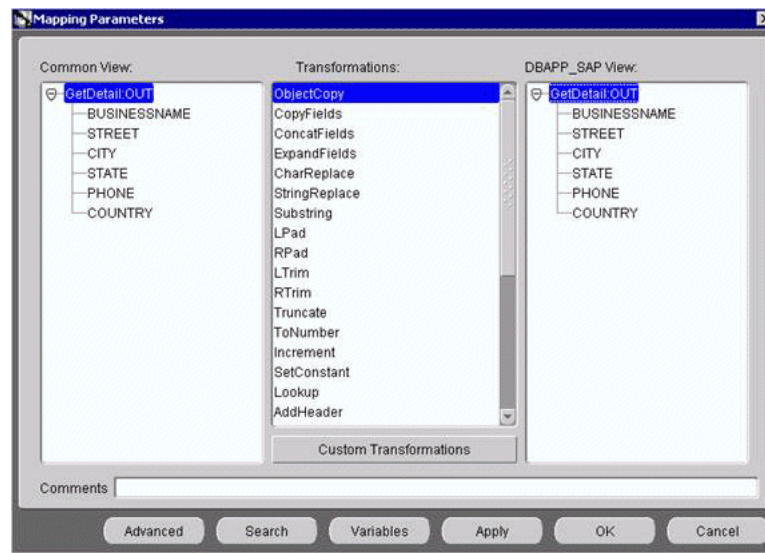

Information appears in the right pane.

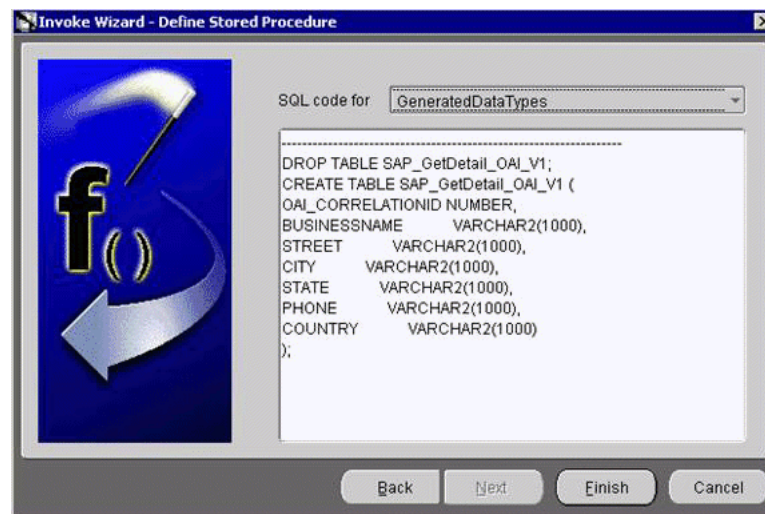

- c. Select the **Synchronous** check box, because this is a request and a response.
4. Click **Next**.
5. Click **New** to create a mapping between the Common View and the Application View for the IN parameters.

In this example, the Application View and the Common View have the same structure. All the attributes can be mapped by using ObjectCopy Transformation.

6. Click **Apply** and then **OK**.
iStudio generates SQL code.

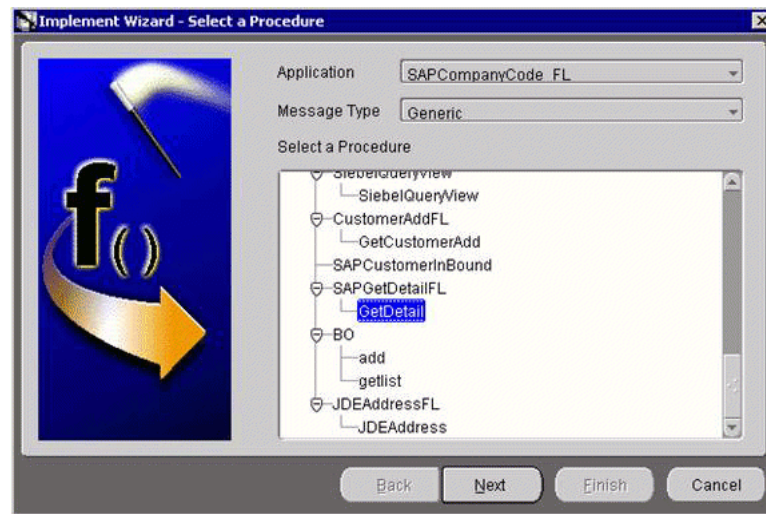

7. Click **Finish**.
The application definition for the invoked procedure is now complete.

Defining an Implemented Procedure

To define an implemented procedure:

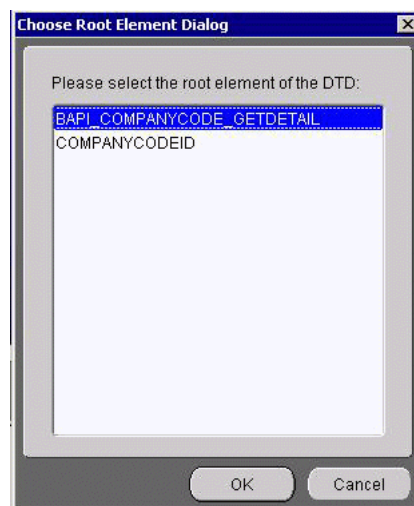

1. Create a new application called `SAPCompanyCodeFL`.
2. Expand `SAPCompanyCode_FL`.
3. Right-click **Implemented Procedure** and select **New**.

The Implement Wizard - Select a Procedure window is displayed.

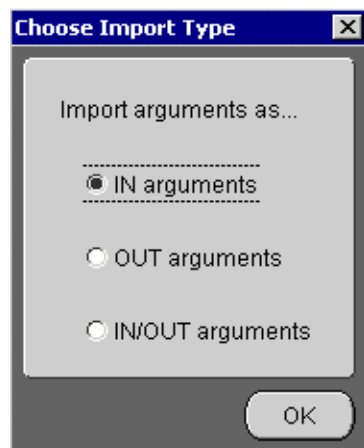

Perform the following steps:

- a. From the **Message Type** list, select **Generic**.
- b. Expand the **SAPGetDetailFL** business object and select **GetDetail** as the procedure.
4. Click **Next**.
 - a. Click **Import**.
 - b. Select **XML**.
 - c. Select the request and response DTDs generated by Application Explorer.
5. Import the request and response DTDs into iStudio.

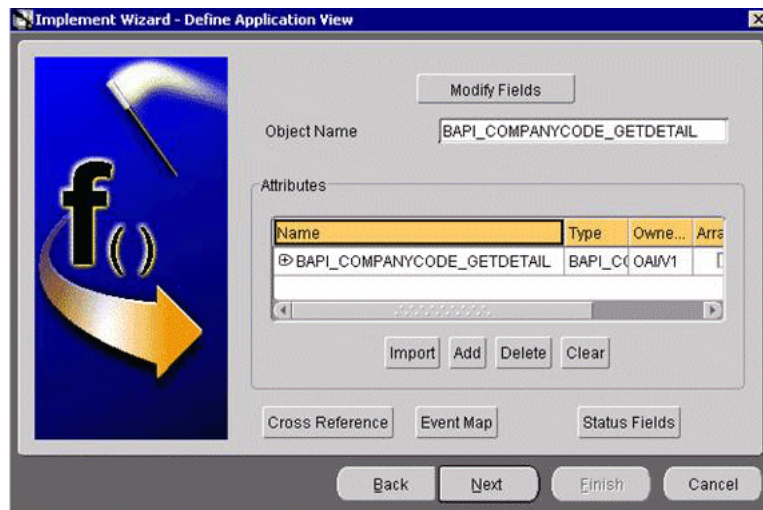

6. Select **BAPI_COMPANYCODE_GETDETAIL** as the root element of the request DTD.

The Choose Import Type dialog box is displayed.

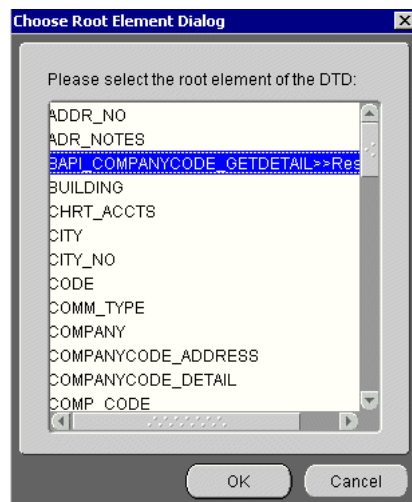

7. Select **IN arguments** as the import type for the request DTD and click **OK**.

The Implement Wizard - Define Application View window is displayed.

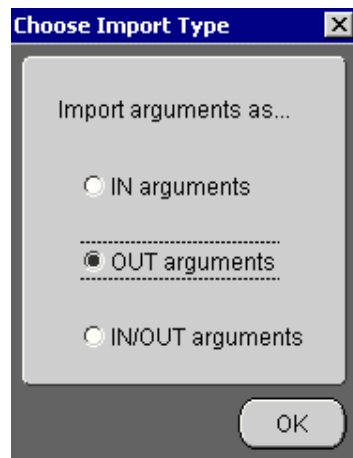

8. Type the root element of the request DTD in the Object Name field, if it is not automatically populated after importing the request DTD and click **Import**.

The Choose Root Element dialog box is displayed.

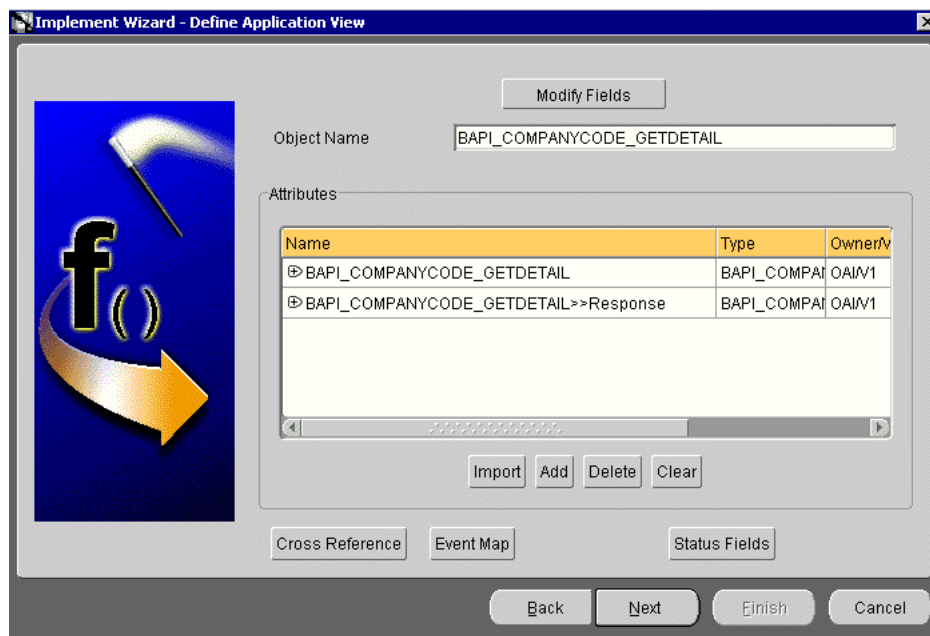

9. Select **BAPI_COMPANYCODE_GETDETAIL** as the root element and click **OK**.

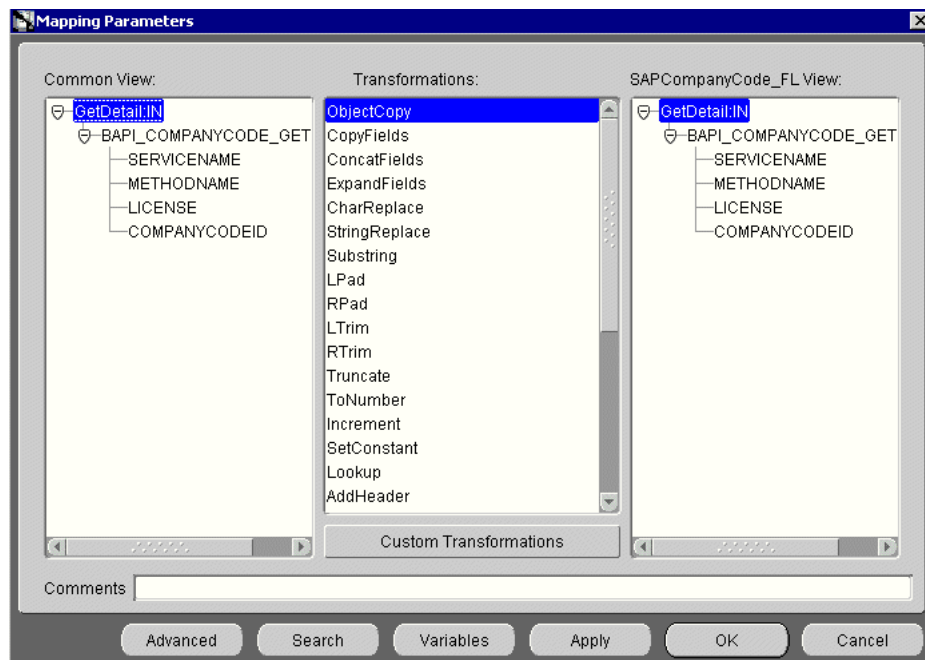

10. Select **OUT arguments** as the import type for the response DTD and click **OK**.

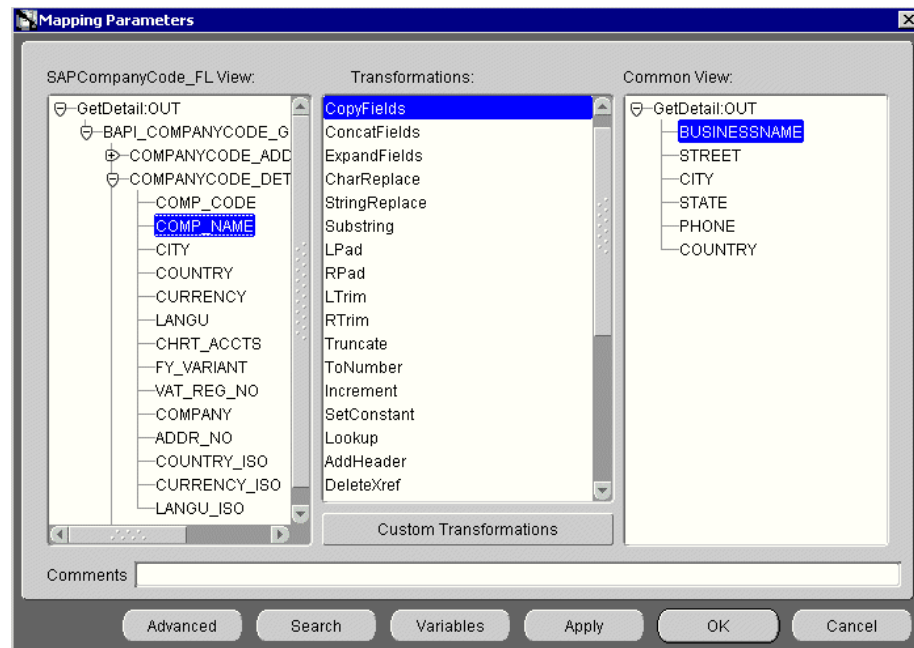

Both the request and response DTDs are now imported into iStudio.

11. To define a mapping between the Application View and the Common View, click **Next** and then **New**.

Because the Common View IN and the Application View IN have the same structure, ObjectCopy transformation is used for the mapping.

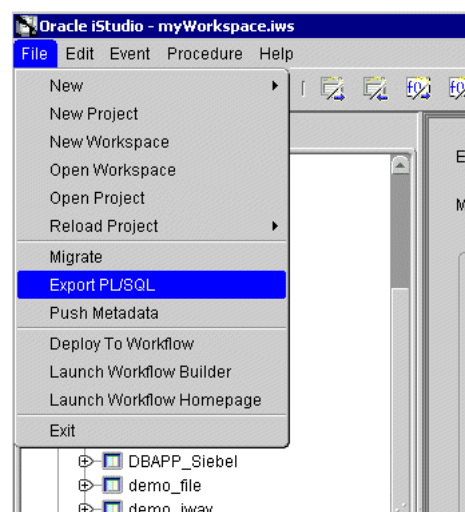

12. Click **Apply** and then **OK**.

13. To complete the definition of the implemented procedure, click **Next** and then **Finish**.

Exporting PL/SQL Code from iStudio

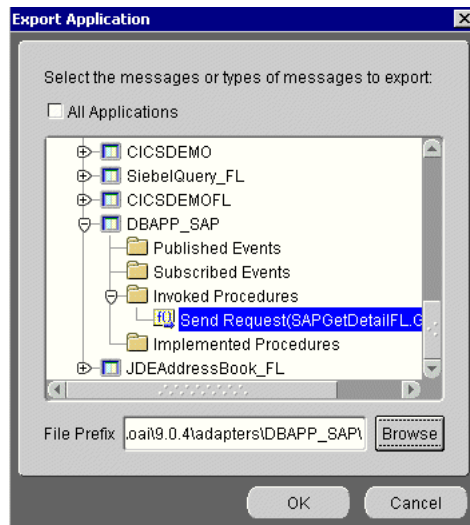

You must export the PL/SQL code created in ["Defining an Implemented Procedure"](#) on page 6-22 and execute it against the appropriate schema. In this example, the schema used is DBAPP_SAP.

To export PL/SQL code from iStudio:

1. In iStudio, click **File** and **Export PL/SQL**.

The Export Application dialog box is displayed.

Perform the following steps:

- a. Select the application from which to export PL/SQL.
- b. Type or browse to the file prefix (path to the application).
2. Click **OK**.

In this example, two SQL scripts are created:

- DBAPP_SAP_SAPGetDetailFLTYPES.sql
 - DBAPP_SAP_SAPGetDetailFL.sql
3. Log on to the database with the appropriate privileges (in this example, DBAPP_SAP) and execute the following in the order given:
 - a. DBAPP_SAP_SAPGetDetailFLTYPES.sql
 - b. DBAPP_SAP_SAPGetDetailFL.sql
 4. Create another stored procedure, COMPANYGETDETAIL_EXE, in the same schema. It executes at runtime to create the database message that is sent to the hub.

```
CREATE OR REPLACE PROCEDURE "DBAPP_SAP"."COMPANYGETDETAIL_EXE" (
servicename LONG,
methodname LONG,
license LONG,
customerid LONG
)
AS
moid NUMBER;
aoid NUMBER;
coid NUMBER;
businessname LONG;
address LONG;
city LONG;
state LONG;
phone LONG;
country LONG;
detailid NUMBER;
BEGIN
  SAPGetDetailFL.crMsg_GetDetail_OAI_V1(moid, aoid);
```

```

detailid := SAPGetDetailFL.cr_BAPI_COMPANYCODE_GETDETAIL_
(servicename,methodname,license,customerid,moid,aoid);
coid := SAPGetDetailFL.inv_GetDetail_OAI_V1(moid,'DBAPP_
SAP',' ',businessname,address,city,state,phone,country);
COMMIT;
END;

```

Editing the adapter.ini File

To edit the adapter.ini file:

1. Open the adapter.ini file.
2. Add the following two lines to adapter.ini for the adapter:

```

// Bridge class
bridge_class=com.iwaysoftware.iwbridge.IWBridge

// IBSE URL
ibse_url=http://hostname:7777/ibse/IBSEServlet/XDSOAPRouter

```

Where hostname is the URL of the server and 7777 is the port number.

OracleAS Integration InterConnect Runtime

The following topic describes how to verify service integration using the OracleAS Adapter for SAP.

Verifying Service Integration

To verify service integration:

1. Start the Oracle Application Server or ensure that the server is running.
2. Restart OC4J, if required, by executing the following command:

```

\OracleAS_home\opmn\bin\opmnctl stopproc process-type=home
\OracleAS_home\opmn\bin\opmnctl startproc process-type=home

```

3. Check the status of OC4J by executing the following command:

```

\OracleAS_home\opmn\bin\opmnctl status

```

4. Invoke and implement the adapter by executing the following commands:

```

\InterConnect_HOME\oai\9.0.4\adapters\SAPCompanyCode_FL\start.bat
\InterConnect_HOME\oai\9.0.4\adapters\DBAPP_SAP\start.bat

```

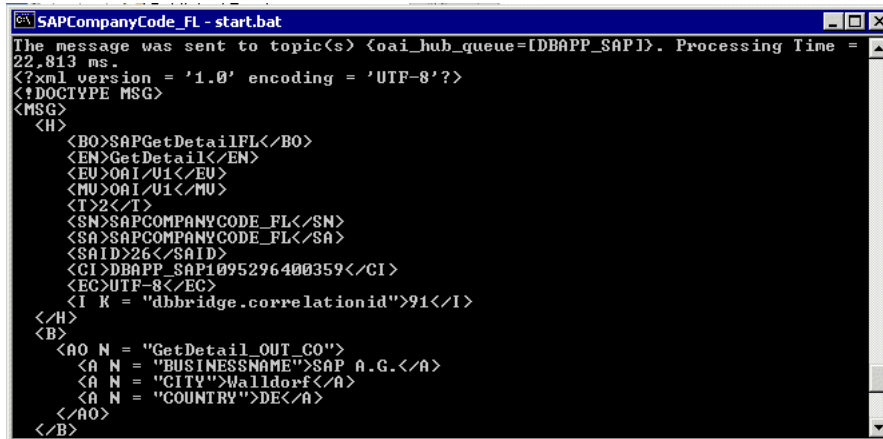

5. Log on to SQL*Plus with DBAPP_SAP and execute the following command:

```

exec
companygetdetail_exe
('BAPI_COMPANYCODE_GETDETAIL','BAPI_COMPANYCODE_GETDETAIL','test','0001');

```

The following image shows the SAPCompanyCode_FL example. It receives a reply from SAP and returns the reply to the hub.

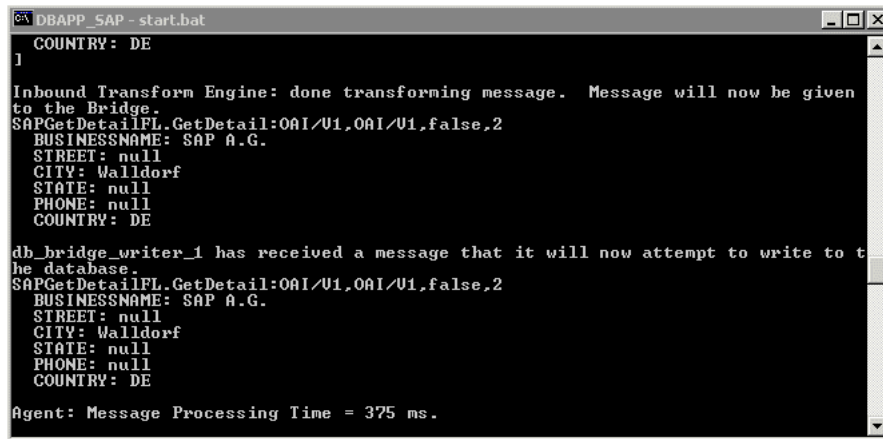

```

SAPCompanyCode_FL - start.bat
The message was sent to topic(s) {oai_hub_queue=IDBAPP_SAP}. Processing Time = 22.813 ms.
<?xml version = '1.0' encoding = 'UTF-8'?>
<!DOCTYPE MSG>

Agent: Message Processing Time = 375 ms.

```

Troubleshooting and Error Messages

This chapter explains the limitations and workarounds when connecting to SAP. The following topics are discussed:

- [Troubleshooting](#)
- [BSE Error Messages](#)

The adapter-specific errors listed in this chapter can arise whether using the adapter with an OracleAS Adapter J2CA or with an OracleAS Adapter Business Services Engine (BSE) configuration.

Troubleshooting

This topic provides troubleshooting information for SAP, separated into four categories:

- Application Explorer
- SAP
- OracleAS Adapter J2CA
- BSE

Note: Log file information that can be relevant in troubleshooting can be found in the following locations:

- The OracleAS Adapter J2CA trace information can be found under the *OracleAS_home\opmn\logs* directory.
 - BSE trace information can be found under the *OracleAS_home\j2ee\home\applications\ws-app-adapter\ibse\ibselogs* directory.
 - The log file for Application Explorer can be found under the *OracleAS_home\adapters\application\tools* directory.
-

Application Explorer

To use Application Explorer on Windows for debugging or testing purposes, load the *ae* batch script, *ae.bat*, found under *OracleAS_home\adapters\application\tools* or on UNIX start the *ae* script, *ae.sh*, found under *OracleAS_home/adapters/application/tools*.

Error	Solution
SAP does not appear in the Application Explorer Adapter node list.	Ensure that the <code>sapjco.jar</code> and <code>sapjcorfc.dll</code> files are added to the <code>lib</code> directory. Ensure the <code>librfc32.dll</code> file is added to the Windows system32 folder.
Cannot connect to OracleAS Adapter for SAP from Application Explorer. Problem activating adapter	Ensure that: <ul style="list-style-type: none"> ■ SAP is running. ■ The Application Server name, System Number, and Client Number are correct. ■ The SAP user ID and password are correct.
Cannot connect to the SAP target through Application Explorer. The following error message appears: Error getting target [SAP] - java.lang.Exception: Error Logon to SAP System	Ensure that you enter the correct connection parameters when connecting to the SAP target.
Cannot connect to your SAP system through Application Explorer. The following error message appears: Problem activating adapter. (com.ibi.sapr3.SapAdapterException : com.sap.mw.jco.JCO\$Exception: (102) RFC_ERROR_COMMUNICATION: Connect to SAP gateway failed Connect_PM GWHOST=isdsvr8, GWSERV=sapgw00, ASHOST=isdsvr8, SYSNR=00 LOCATION CPIC (TCP/IP) on local host ERROR partner not reached (host isdsvr8, service 3300) TIME Fri Aug 27 11:49:14 2004 RELEASE 620 COMPONENT NI (network interface) VERSION 36 RC -10 MODULE ninti.c LINE 979 DETAIL NiPConnect2 SYSTEM CALL SO_ERROR ERRNO 10061 ERRNO TEXT WSAECONNREFUSED: Connection refused COUNTER 1). Check logs for more information	Ensure that SAP is running and that you are using the correct parameter values to connect to your application server.
Cannot connect to your SAP system through Application Explorer even though SAP is running. The following error message appears: Problem activating adapter. (com.ibi.sapr3.SapAdapterException : java.lang.ExceptionInInitializerError: JCO.classInitialize(): Could not load middleware layer 'com.sap.mw.jco.rfc.MiddlewareRFC' JCO.nativeInit(): Could not initialize dynamic link library sapjcorfc [no sapjcorfc in java.library.path]. java.library.path	Ensure that the <code>sapjcorfc.dll</code> file is added to the <code>lib</code> directory and the <code>librfc32.dll</code> file is added to the Windows system32 folder.

Error	Solution
<p>The dll is loaded in another classloader (BSE and J2CA are installed on the same server). The following error message appears:</p> <pre>com.ibi.sapr3.SapAdapterException: java.lang.ExceptionInInitializerEr ror: JCO.classInitialize(): Could not load middleware layer 'com.sap.mw.jco.rfc.MiddlewareRFC' JCO.nativeInit(): Could not initialize dynamic link library sapjcorfc [Native Library F:\iWay55.008.0628\lib\sapjcorfc.d ll already loaded in another classloader]. java.library.path</pre>	<p>Add sapjco.jar to the server classpath.</p>
<p>Unable to start Application Explorer in a Solaris environment. The following exception is thrown in the console:</p> <pre>javax.resource.ResourceException: IWAManagedConnectionFactory: License violation.at com.ibi.afjca.spi.IWAManagedConne ctionFactory.createConnectionFacto ry(IWAManagedConnectionFactory.ja va:98)at com.iwaysoftware.iwae.common.JCATr ansport.getConnectionFactory(JCATr ansport.java:133) at com.iwaysoftware.iwae.common.JCATr ansport.initJCA(JCATransport.java: 69)at com.iwaysoftware.iwae.common.JCATr ansport.<init>(JCATransport.java:6 2)at com.iwaysoftware.iwae.common.Adapt erClient.<init>(AdapterClient.java :85)at com.ibi.bse.ConfigWorker.run(Confi gWorker.java:41) at java.lang.Thread.run(Thread.java:5 34)</pre> <p>Could not create the connection factory.</p>	<p>JAVACMD is not set on the user system. Before starting Application Explorer, export JAVACMD as follows:</p> <p>JAVACMD=/<jdk_home>/bin/java, where <jdk_home> is the directory where JDK is installed on your machine.</p>
<p>Logon failure error at runtime</p>	<p>If the password for connecting to your SAP system is not specified when creating a target or with the Edit option in Application Explorer, you will be unable to connect to SAP. The connection password is not saved in repository.xml. Update the password using the Edit option in Application Explorer, then restart the application server.</p>
<p>The following exception occurs when you start Application Explorer by activating ae.bat (not iaexplorer.bat):</p> <pre>java.lang.ClassNotFoundException: org.bouncycastle.jce.provider.Boun cyCastleProvider</pre>	<p>This is a benign exception. It does not affect adapter functionality. Download BouncyCastle files from:</p> <p>ftp://ftp.bouncycastle.org/pub</p>

SAP

Error	Solution
When executing a request, the following error message appears: AdapterException: java.lang.Exception: Function module CUSTOMER_GETDETAIL2 does NOT exist.	Check the syntax of your input XML document and make sure the name of the Remote Function module is correct, available in SAP, and activated.
When executing a request, the following error message appears: AdapterException: java.lang.Exception: Object type unknown for business object: CUST	Check the syntax of your input XML document and verify that the Business Object type exists in SAP and is correct and activated. Also verify that the name of your document is correct.
When executing a request, the following error message appears: AdapterException: java.lang.Exception: Unable to retrieve BAPI name for: CUSTOMER.DETAIL2	Check the syntax of your input XML document and verify that the name of the BAPI is correct, available in SAP, and activated.
When executing a request, the following error message appears: java.lang.RuntimeException: com.sap.mw.jco.JCO\$AbapException: (126) OBJECT_UNKNOWN: Basic type or extension does not exist.	Check the syntax of your input XML document and verify that the IDoc type or extension type is correct, available in SAP, and activated.
When executing a request, the following error message appears: AdapterException: java.lang.Exception: BapiError/BapiAbort: You are not authorized to display customers.	Verify that your user ID has the correct permissions configured in SAP. Consult your SAP administrator for more information.

Note: Activation is an important SAP concept. If an object does not exist in an activated state, it may appear as present on the system, but is not available for use. This is especially important for IDOCs and SAP Business Objects. Consult your SAP documentation for further information.

OracleAS Adapter J2CA

Error	Solution
In Application Explorer, the following error message appears when you attempt to connect to an OracleAS Adapter J2CA configuration: Could not initialize JCA	In the Details tab in the right pane, ensure that the directory specified in the Home field points to the correct directory, for example, <i>OracleAS_home\adapters\application</i>

BPEL Process Manager

Error	Solution
Endpoint activation error on deployment of SAP event handling project (inbound) in JDeveloper	Verify that the channel used for this inbound J2CA service is stopped in Application Explorer. If you have started this channel for testing or debugging purposes, you must stop it before starting BPEL PM Server. Endpoint activation is managed by BPEL Process Manager.
The following error message appears in BPEL PM Server Console: <pre>Process "TestSAP" (revision "1.0") compilation failed. <2005-05-18 10:49:53,285> <ERROR><default.collaxa.cube.engine e.deployment> <Cube ProcessLoader::create> Failed to read wsdl. Error happened when reading wsdl at "http://127.0.0.1:7777/BPELConsole /wsil/adapters/applications/CUSTOM ER_invoke.wsdl?wsdl", because "WSDLException: faultCode=INVALID_ WSDL: Invalid XML in document at: http://127.0.0.1:7777/BPELConsole/ wsil/adapters/applications/CUSTOM ER_invoke.wsdl?wsdl: The element type "P" must be terminated by the matching end-tag "</P>".</pre>	Verify that the specified WSDL file exists at that URL and that the file is valid. Workaround: Change the WSDL location to localhost:7777. The default is 127.0.0.1:7777. Alternative workaround: Add the IP address to the Dhhttp.nonProxyHosts list found in obsetenv.bat (Windows) or obsetenv.sh (Unix)
The following exception is thrown in JDeveloper during deployment of the BPEL process: <pre>java.io.FileNotFoundException: \BPELConsole\wsil\adapters\applica tions\DEBMA01_receive.wsdl?wsdl (The system cannot find the path specified)</pre>	Verify that you have all the required patches installed. The required patches are listed and updated on the Oracle Technology Network Web site.

BSE Error Messages

This topic discusses the different types of errors that can occur when processing Web services through BSE.

General Error Handling in BSE

BSE serves as both a SOAP gateway into the adapter framework and as the engine for some of the adapters. In both design time and execution time, various conditions can cause errors in BSE when Web services that use adapters are running. Some of these conditions and resulting errors are exposed the same way, regardless of the specific adapter; others are exposed differently, based on the adapter being used. This topic explains what you can expect if you encounter some of the more common error conditions on an adapter-specific basis. Usually the SOAP gateway (**agent**) inside BSE passes a SOAP request message to the adapter required for the Web service. If an error occurs, how it is exposed depends on the adapter and the API or interfaces that the adapter uses. A few scenarios cause the SOAP gateway to generate a SOAP fault. In general, anytime the SOAP agent inside BSE receives an invalid SOAP request, a SOAP fault element is generated in the SOAP response. The SOAP fault element

contains fault string and fault code elements. The fault code contains a description of the SOAP agent error.

The following SOAP response document results when BSE receives an invalid SOAP request:

```
<SOAP-ENV:Envelope xmlns:SOAP-ENV="http://schemas.xmlsoap.org/soap/envelope/">

  <SOAP-ENV:Body>
    <SOAP-ENV:Fault>
      <faultcode>SOAP-ENV:Client</faultcode>
      <faultstring>Parameter node is missing</faultstring>
    </SOAP-ENV:Fault>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```

In this example, BSE did not receive an element in the SOAP request message that is mandatory for the WSDL for this Web service.

Adapter-Specific Error Handling

When an adapter raises an exception during execution, the SOAP agent in BSE produces a SOAP fault element in the generated SOAP response. The SOAP fault element contains fault code and fault string elements. The fault string contains the native error description from the adapter target system. Since adapters use the target system interfaces and APIs, whether or not an exception is raised depends on how the target systems interface or API treats the error condition. If a SOAP request message is passed to an adapter by the SOAP agent in BSE and that request is invalid based on the WSDL for that service, the adapter may raise an exception yielding a SOAP fault. While it is almost impossible to anticipate every error condition that an adapter may encounter, the following is a description of how adapters handle common error conditions and how they are then exposed to the Web services consumer application.

OracleAS Adapter for SAP Invalid SOAP Request

If OracleAS Adapter for SAP receives a SOAP request message that does not conform to the WSDL for the Web services being executed, then the following SOAP response is generated.

```
<?xml version="1.0" encoding="ISO-8859-1" ?>
<SOAP-ENV:Envelope xmlns:SOAP-ENV="http://schemas.xmlsoap.org/soap/envelope/">
<SOAP-ENV:Body>
<SOAP-ENV:Fault>
  <faultcode>SOAP-ENV:Server</faultcode>
  <faultstring>Error processing agent [XDSapIfrAgent] - XD[FAIL] SapIFRException:
java.sql.SQLException:
com.ibi.sapjco.SapCallableStatement: execute() j
java.util.NoSuchElementException</faultstring>
  </SOAP-ENV:Fault>
</SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```

Empty Result From SOAP Request

If OracleAS Adapter for SAP executes an SAP object using input parameters passed in the SOAP request message that do not match records in SAP, then the following SOAP response is generated.

```
<?xml version="
1.0" encoding="ISO-8859-1" ?>
```

```

<SOAP-ENV:Envelope xmlns:SOAP-ENV="http://schemas.xmlsoap.org/soap/envelope/">
<SOAP-ENV:Body>
  <SOAP-ENV:Fault>
    <faultcode>SOAP-ENV:Server</faultcode>
    <faultstring>Error processing agent [XDSapIfrAgent] - XD[FAIL] SapIFRException:
java.sql.SQLException: com.ibi.sapjco.SapCallableStatement: execute()
java.sql.SQLException: JCO Error Key: NO_RECORD_FOUND Short Description:
com.sap.mw.jco.JCO$AbapException: (126) NO_RECORD_FOUND: NO_RECORD_
FOUND</faultstring>
  </SOAP-ENV:Fault>
</SOAP-ENV:Body>
</SOAP-ENV:Envelope>

```

Failure to Connect to SAP

If OracleAS Adapter for SAP cannot connect to SAP when executing a Web service, then the following SOAP response is generated:

```

<?xml version="1.0" encoding="ISO-8859-1" ?>
<SOAP-ENV:Envelope xmlns:SOAP-ENV="http://schemas.xmlsoap.org/soap/envelope/">
<SOAP-ENV:Body>
  <SOAP-ENV:Fault>
    <faultcode>SOAP-ENV:Server</faultcode>
    <faultstring>Error processing agent [XDSapIfrAgent] - XD[RETRY]
Connect to SAP gateway failed Connect_PM GWHOST=ESDSUN, GWSERV=sapgw00,
ASHOST=ESDSUN,
SYSNR=00 LOCATION CPIC (TCP/IP) on local host ERROR partner not reached (host
ESDSUN, service 3300)
TIME Mon Jun 30 16:01:02 2003 RELEASE 620 COMPONENT NI (network interface) VERSION
36 RC -10 MODULE ninti.c LINE 976 DETAIL NiPConnect2
SYSTEM CALL SO_ERROR ERRNO 10061 ERRNO TEXT WSAECONNREFUSED: Connection refused
COUNTER 1</faultstring>
  </SOAP-ENV:Fault>
</SOAP-ENV:Body>
</SOAP-ENV:Envelope>

```

Invalid SOAP Request

If OracleAS Adapter for SAP receives a SOAP request message that does not conform to the WSDL for the Web services being executed, then the following SOAP response is generated.

```

<?xml version="1.0" encoding="ISO-8859-1" ?>
<SOAP-ENV:Envelope xmlns:SOAP-ENV="http://schemas.xmlsoap.org/soap/envelope/">
<SOAP-ENV:Body>
  <SOAP-ENV:Fault>
    <faultcode>SOAP-ENV:Server</faultcode>
    <faultstring>RPC server connection failed: Connection refused:
connect</faultstring>
  </SOAP-ENV:Fault>
</SOAP-ENV:Body>
</SOAP-ENV:Envelope>

```

Empty Result From OracleAS Adapter for SAP Request

If OracleAS Adapter for SAP executes a SOAP request using input parameters passed that do not match records in the target system, then the following SOAP response is generated.

Note: The condition for this adapter does not yield a SOAP fault.

```
<SOAP-ENV:Envelope xmlns:xsi="http://www.w3.org/1999/XMLSchema-instance"
xmlns:SOAP-ENV="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:xsd="http://www.w3.org/1999/XMLSchema">
  <SOAP-ENV:Body>
    <m:RunDBQueryResponse xmlns:m="urn:schemas-iwaysoftware-com:iwse"
      xmlns="urn:schemas-iwaysoftware-com:iwse"
      cid="2A3CB42703EB20203F91951B89F3C5AF">
      <RunDBQueryResult run="1" />
    </m:RunDBQueryResponse>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```

Advanced User Tools

This chapter includes the following topics:

- [Web Services Policy-Based Security](#)
- [Migrating Repositories](#)

Web Services Policy-Based Security

Application Explorer provides a security model called Web services policy-based security. The following topics describe how the feature works and how to configure it.

Web services provide a layer of abstraction between the back-end business logic and the user or application running the Web service. This enables easy application integration but raises the issue of controlling the use and execution of critical and sensitive business logic that is run as a Web service.

Application Explorer controls the use of Web services that use adapters, using a feature called policy-based security. This feature enables an administrator to apply "policies" to Business Services (Web services) to deny or permit their execution.

A policy is a set of privileges dealing with the execution of a Business Service (BS) that can be applied to an existing or new BS. When you set specific rights or privileges inside a policy, you do not have to re-create privileges for every BS that has security concerns in common with other Business Services. Instead, you reuse a policy on multiple Business Services.

The goal of the feature is to secure requests at both the transport and the SOAP request level transmitted on the wire. Some of the policies do not deal with security issues directly, but do affect the runtime behavior of the Web services to which they have been applied.

The Business Services administrator creates an "instance" of a policy type, names it, associates individual users or groups (a collection of users), and then applies that policy to one or more Business Services.

You can assign a policy to a Business Service, or to a method within a Business Service. If a policy is only applied to a method, other methods in that Business Service will not be governed by it. However, if a policy is applied to the Business Service, all methods are governed by it. At runtime, the user ID and password that are sent to BSE in the SOAP request message are verified against the list of users for all policies applied to that specific Business Service. The policy type that is supported is Resource Execution, which dictates who can or cannot execute the Business Service.

When a policy is not applied, the default value for a Business Service is to "grant all". For example, anybody can execute the Business Service, until the Resource Execution policy is associated to the Business Service. At that time, only those granted execution

permissions, or users not part of the group that has been denied execution permissions, have access to the Business Service.

Configuring Web Services Policy-Based Security

The following procedures describe how to configure Web services policy-based security.

Creating and Associating a User with a Policy

Before you create instances of policies, you must have a minimum of one user or one group to associate to an instance. You can create users and groups using Application Explorer.

1. Open Application Explorer.
2. Right-click the configuration to which you want to connect, for example, SampleConfig. See [Chapter 2, "Configuring OracleAS Adapter for SAP"](#) for information on creating a new configuration.
3. Select **Connect**.

Nodes appear for Adapters, Events, and Business Services (also known as Web services).

Perform the following steps:

- a. Expand the **Business Services** node.
- b. Expand the **Configuration** node.
- c. Expand the **Security** node.
- d. Expand the **Users and Groups** node.

4. Right-click **Users** and click **New User**.

The New User dialog box is displayed.

Provide the following information:

- a. In the **Name** field, enter a user ID.
- b. In the **Password** field, enter the password associated with the user ID.
- c. In the **Description** field, enter a description of the user (optional).

5. Click **OK**.

The new user is added under the Users node.

Creating a Group to Use With a Policy

To create a group to use with a policy:

1. Open Application Explorer.
2. Right-click the configuration to which you want to connect, for example, SampleConfig. See [Chapter 2, "Configuring OracleAS Adapter for SAP"](#) for information on creating a new configuration.

3. Select **Connect**.

Nodes appear for Adapters, Events, and Business Services (also known as Web services).

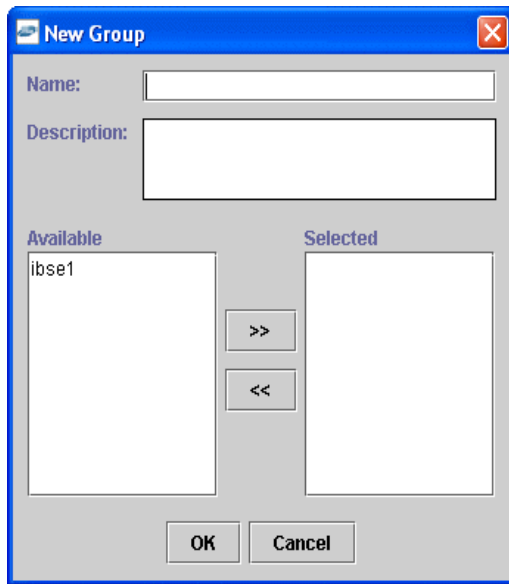

Perform the following steps:

- a. Expand the **Business Services** node.
- b. Expand the **Configuration** node.
- c. Expand the **Security** node.
- d. Expand the **Users and Groups** node.

4. Right-click **Groups** and select **New Group**.

The New Group dialog box is displayed.

Provide the following information:

- a. In the **Name** field, enter a name for the group.
 - b. In the **Description** field, enter a description for the group (optional).
 - c. From the available list of users in the left pane, select one or more users and add them to the **Selected** list by clicking the double right-facing arrow.
5. When you have selected at least one user, click **OK**.

The new group is added under the Group node.

Creating an Execution Policy

An execution policy governs who can execute the Business Services to which the policy is applied.

To create an execution policy:

1. Open Application Explorer.
2. Right-click the configuration to which you want to connect, for example, SampleConfig. See [Chapter 2, "Configuring OracleAS Adapter for SAP"](#) for information on creating a new configuration.
3. Select **Connect**.

Nodes appear for Adapters, Events, and Business Services (also known as Web services).

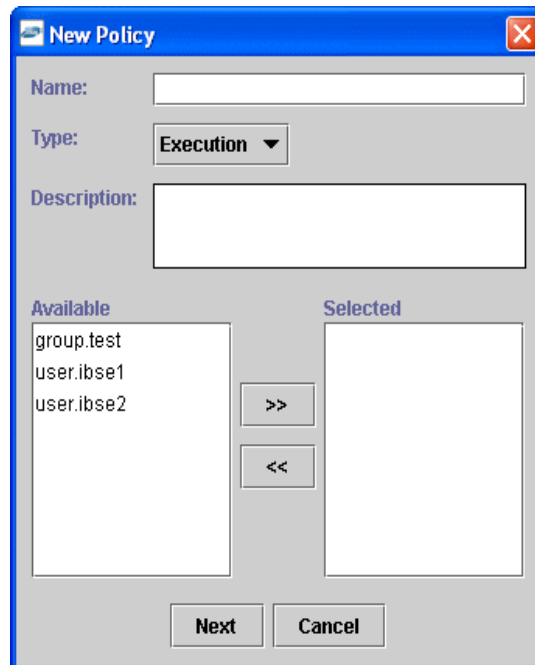

Perform the following steps:

- a. Expand the **Business Services** node.
- b. Expand the **Configuration** node.
- c. Expand the **Security** node.
- d. Expand the **Policies** node.

4. Right-click **Policies** and select **New Policy**.
The New policy dialog box is displayed.

Provide the following information:

- a. In the **Name** field, enter a name for the policy.
- b. From the **Type** list, select **Execution**.
- c. In the **Description** field, enter a description for the policy (optional).
- d. From the available list of users in the left pane, select one or more users and add them to the **Selected** list by clicking the double right-facing arrow.

Note: This user ID is verified against the value in the user ID element of the SOAP header sent to BSE in a SOAP request.

5. When you have selected at least one user selected, click **OK**.

6. Click **Next**.

The New Policy permissions dialog box is displayed.

7. To grant permission to a user or group to execute a Business Service, select the user or group and move them into the **Execution Granted** list by selecting the double left-facing arrow.
8. To deny permission to a user or group to execute a Business Service, select the user or group and move them into the **Execution Denied** list by selecting the double right-facing arrow.
9. Click **OK**.

The following pane summarizes your configuration.

- ◆ **Name** test
- ◆ **Type** Execution
- ◆ **Description**
- ◆ **User and Group Restrictions**
 - ◆ group.test Execution Granted

Using the IP and Domain Restrictions Policy Type

You configure the IP and Domain Restriction policy type slightly differently from other policy types. The IP and Domain Restriction policy type controls connection access to BSE and therefore need not be applied to individual Web services. You need not create a policy; however, you must enable the Security Policy option in Application Explorer.

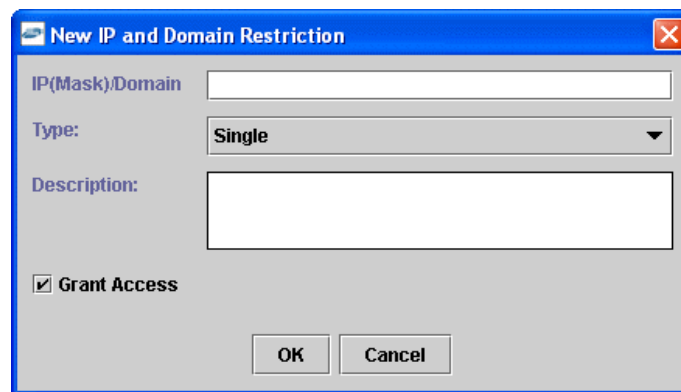

1. Open Application Explorer.
2. Right-click the configuration to which you want to connect, for example, SampleConfig. See [Chapter 2, "Configuring OracleAS Adapter for SAP"](#) for information on creating a new configuration.
3. Select **Connect**.

Nodes appear for Adapters, Events, and Business Services (also known as Web services).

- a. Expand the **Business Services** node.
- b. Expand the **Configuration** node.
- c. Expand the **Security** node.

4. Right-click **IP and Domain** and select **New IP and Domain Restriction**.
The New IP and Domain Restriction dialog box is displayed.

Provide the following information:

- a. In the **IP(Mask)/Domain** field, enter the IP or domain name using the following guidelines.

If you select **Single** (Computer) from the **Type** list, you must provide the IP address for that computer. If you only know the DNS name for the computer, click **DNS Lookup** to obtain the IP Address based on the DNS name.

If you select **Group** (of Computers), you must provide the IP address and subnet mask for the computer group.

If you select **Domain**, you must provide the domain name.
- b. From the **Type** list, select the type of restriction.
- c. In the **Description** field, enter a description (optional).
- d. To grant access, select the **Grant Access** check box.

5. Click **OK**.

The new domain is added under the IP and Domain node.

The following pane summarizes your configuration.

- ◆ **IP Address (Mask) /Domain** www.yahoo.com
- ◆ **Type** Domain
- ◆ **Access** Denied
- ◆ **Description**

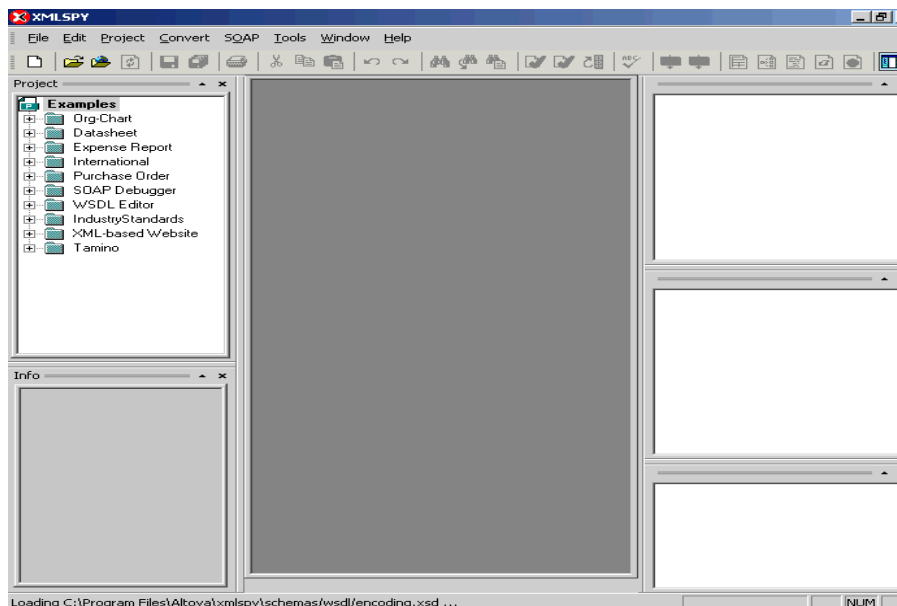

Migrating Repositories

During design time, the Oracle repository is used to store metadata created when using Application Explorer to configure adapter connections, browse EIS objects, configure services, and configure listeners to listen for EIS events. The information in the repository is also referenced at runtime. For management purposes, you can migrate BSE and J2CA repositories that are configured for Oracle to new destinations without affecting your existing configuration. For example, you may want to migrate a repository from a test environment to a production environment.

Migrating a BSE Repository

To migrate a BSE repository:

1. Copy the BSE control service URL, for example:
`http://localhost:7777/ibse/IBSEServlet/admin/iwcontrol.ibs`
2. Open a third-party XML editor, for example, XMLSPY.

3. In the menu bar, click **SOAP**.

A list of options appears.

4. Select **Create new SOAP request**.

The WSDL file location dialog box is displayed.

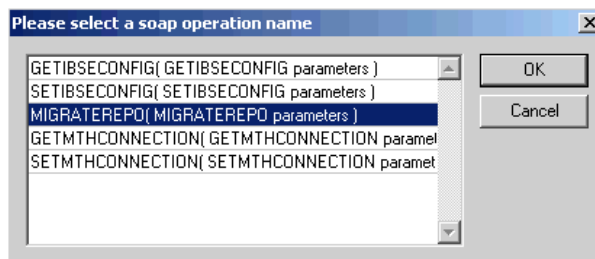

a. In the **Choose a file** field, paste the BSE control service URL.

b. Append **?wsdl** to the URL, for example:

`http://localhost:7777/ibse/IBSEServlet/admin/iwcontrol.ibs?wsdl`

5. Click **OK**.

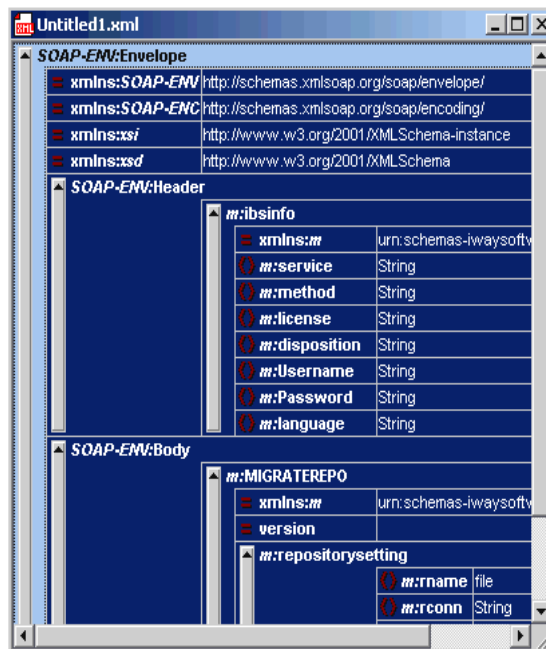

The soap operation name dialog box is displayed and the available control methods are listed.

6. Select the **MIGRATEREPO(MIGRATEREPO parameters)** control method and click **OK**.

Note: The **MIGRATEREPO(MIGRATEREPO parameters)** control method is available from the BSE administration console. This control method migrates all Web services to the new (empty) repository. You can choose to migrate select Web services only.

The following window is displayed, showing the structure of the SOAP envelope.

7. Locate the **Text view** icon in the toolbar.

8. To display the structure of the SOAP envelope as text, click **Text view**.

The `<SOAP-ENV:Header>` tag is not required and can be deleted from the SOAP envelope.

9. Locate the following section:

```
<m:MIGRATEREPO xmlns:m="urn:schemas-iwaysoftware-com:jul2003:ibse:config"
version=" ">
  <m:repositorysetting>
    <m:rname>oracle</m:rname>
    <m:rconn>String</m:rconn>
    <m:rdriver>String</m:rdriver>
    <m:ruser>String</m:ruser>
    <m:rpwd>String</m:rpwd>
  </m:repositorysetting>
  <m:servername>String</m:servername>
</m:MIGRATEREPO>
```

Perform the following steps:

- a. For the `<m:rconn>` tag, replace the String placeholder with a repository URL where you want to migrate your existing BSE repository.

The Oracle repository URL has the following format:

```
jdbc:oracle:thin:@[host]:[port]:[sid]
```

- b. For the `<m:rdriver>` tag, replace the String placeholder with the location of your Oracle driver.
 - c. For the `<m:ruser>` tag, replace the String placeholder with a valid user name to access the Oracle repository.
 - d. For the `<m:rpwd>` tag, replace the String placeholder with a valid password to access the Oracle repository.
10. Perform one of the following migration options.
- If you want to migrate a single Web service from the current BSE repository, enter the Web service name in the `<m:servicename>` tag, for example:

```
<m:servicename>SAPService1</m:servicename>
```
 - If you want to migrate multiple Web services from the current BSE repository, duplicate the `<m:servicename>` tag for each Web service, for example:

```
<m:servicename>SAPService1</m:servicename>
<m:servicename>SAPService2</m:servicename>
```
 - If you want to migrate all Web services from the current BSE repository, remove the `<m:servicename>` tag.

11. In the menu bar, click **SOAP** and select **Send request to server**.

Your BSE repository and any Web services you specified are now migrated to the new Oracle repository URL you specified.

Migrating a J2CA Repository

To migrate a J2CA repository:

1. Navigate to the location of your J2CA configuration directory where the repository schemas and other information is stored, for example:

```
OracleAS_home\adapters\application\config\JCA_CONFIG
```

Where JCA_CONFIG is the name of your J2CA configuration.

2. Locate and copy the `repository.xml` file.
3. Place this file in a new J2CA configuration directory to migrate the existing repository.

Your J2CA repository is migrated to the new J2CA configuration directory.

Configuring SAP for Inbound and Outbound Processing

During inbound (client) processing, IDocs are transferred to the interface and stored in the R/3 System. The document data is generated in a second step, also in the course of a workflow.

Outbound processing in SAP involves event handling. An event in SAP is defined as an occurrence of a status change in an object. Events are created when the relevant status change occurs.

The following topics describe how to enable inbound and outbound SAP processing.

- [Configuring SAP Inbound Processing](#)
- [Configuring SAP Outbound Processing](#)

Configuring SAP Inbound Processing

SAP inbound processing requires the upstream system to transfer an IDoc to the IDoc interface through the R/3 System port. For this reason, you do not have to specify a port in the inbound partner profiles; the IDoc interface only must recognize the upstream system as a port. A port definition, which provides a unique ID for the upstream system, must be available for the port. The technical parameters of this port definition can (and usually are) overwritten by the upstream system.

If the upstream system is recognized, then the IDoc is saved in the database. If a partner is defined with the corresponding message in partner profiles, the IDoc is then processed further. This is done independently in the second step. This ensures that the external system can receive the data quickly and reliably (automatically).

You must perform the following steps to configure SAP for inbound IDoc processing:

1. Configure a logical system.
2. Configure a distribution model.
3. Define an inbound partner profile.

Configuring a Logical System

In any distributed environment, each participating system must have a unique ID to avoid confusion. In SAP, the name of the logical system is used as the unique ID. This name is assigned explicitly to one client in an SAP system.

Defining a Logical System

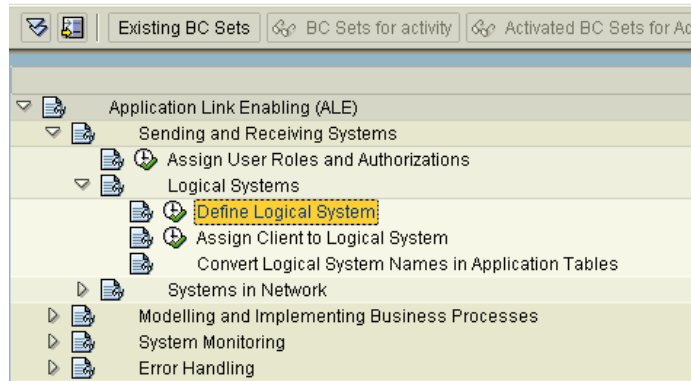

To define a logical system:

1. Execute the **sale** transaction.

The Display IMG window is displayed.

Display IMG

Perform the following steps:

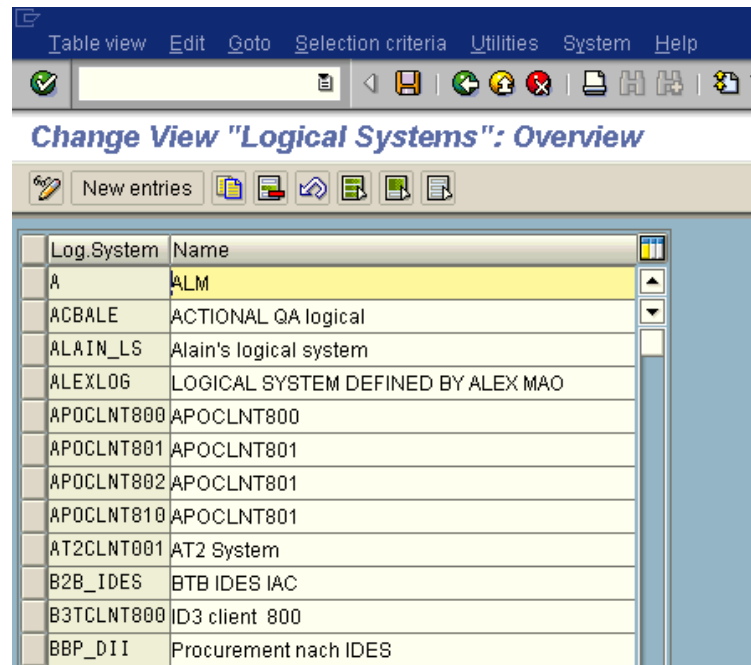

- a. Expand **Sending and Receiving Systems**.
 - b. Expand **Logical Systems**.
 - c. Select **Define Logical System**.
2. Click the **IMG - Activity** icon.

A message window is displayed. It indicates that the table is cross-client.

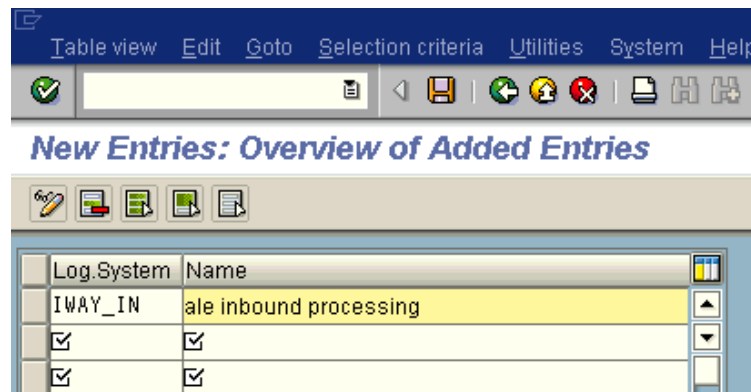

3. Click the **check mark** icon to continue.

The Change View "Logical Systems": Overview window is displayed.

4. Click **New Entries**.

The New Entries: Overview of Added Entries window is displayed.

5. Enter the Logical System, for example, ORACLETDS, in the **Log.System** column and provide a description in the **Name** column.

6. Click **Save**.

The Prompt for Workbench request dialog box is displayed.

7. Click the **Create Request** icon.

The Create Request dialog box is displayed.

8. Enter a name and description for your request and click **Save**.

The logical system you configured, for example, ORACLETDS, is now added to the list.

IWAYMKT	IWAY marketing logical system
IWAY_IN	ale inbound processing
JRB46LS	jr logical

Configuring a Distribution Model

A distribution model is used to describe the ALE message flow between logical systems. Business objects are distributed to connected recipients according to a unique distribution model that can contain rules of varying complexity depending on the type of business objects involved.

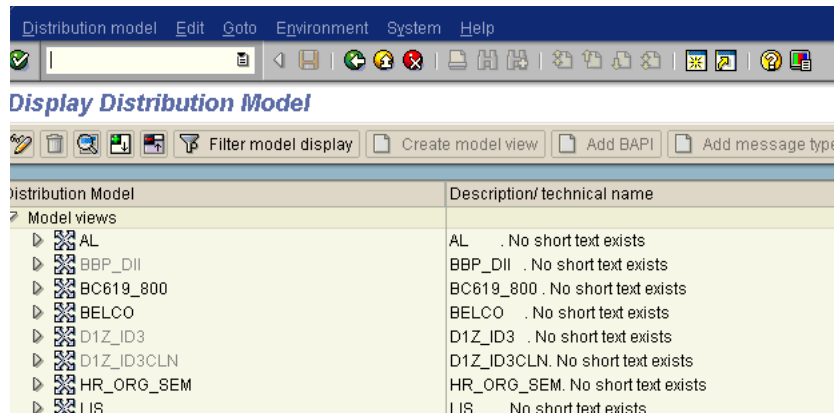

Defining a Distribution Model

To define a distribution model:

1. Execute the **bd64** transaction.

The Display Distribution Model window is displayed.

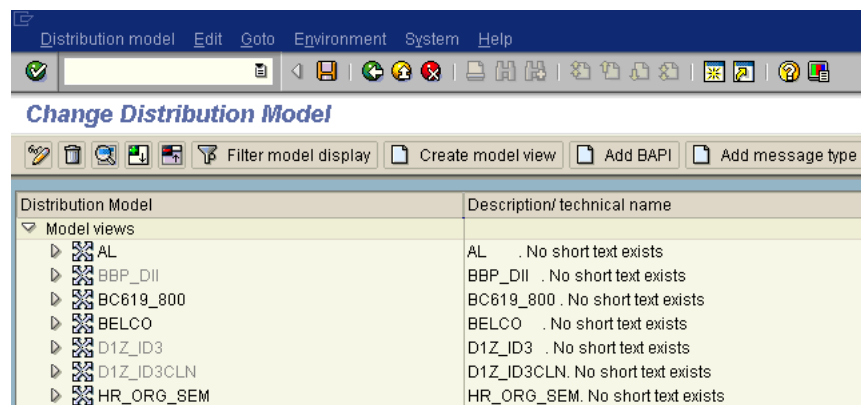

- Click **Distribution Model** from the menu bar.

- Select **Switch processing mode**.

The Display Distribution Model window is switched to Change Distribution Model.

- Click **Create model view**.

The Create Model View dialog box is displayed.

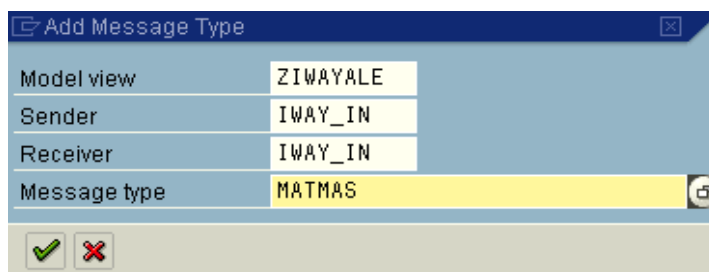

5. Enter a model view name in the **Short text** field and a name in the **Technical name** field, which also serves as a description.
6. Click the **check mark** icon to enter the information.

You are returned to the main Change Distribution Model window. The distribution model you configured is now added to the list.

▶  detlef	DETLEF
▶  iway Distribution Model for alpha class	IWAYMOD09
▶  iway ale inbound	ZIWAYALE
▶  iway marketing distribution model	IWAYMKT

7. Click **Add message type**.

The Add Message Type dialog box is displayed.

The dialog box titled "Add Message Type" contains the following fields:

Model view	ZIWAYALE
Sender	IWAY_IN
Receiver	IWAY_IN
Message type	MATMAS

At the bottom left are checkmark and X icons. At the bottom right is a copy icon.

Perform the following steps:

- a. In the **Sender** and **Receiver** fields, enter the logical system you configured, for example, ORACLETDS.

You can click the icon to the right of each field to browse from a list of logical systems.

- b. In the **Message type** field, enter the message type you want to use, for example, MATMAS.

You can click the icon to the right of each field to browse from a list of available message types.

8. Click the **check mark** icon to enter the information.

You are returned to the main Change Distribution Model window.

9. Click **Save**.

Defining a Partner Profile

Partner profiles are a prerequisite for data exchange. This involves defining who can exchange messages with the SAP system and using which port.

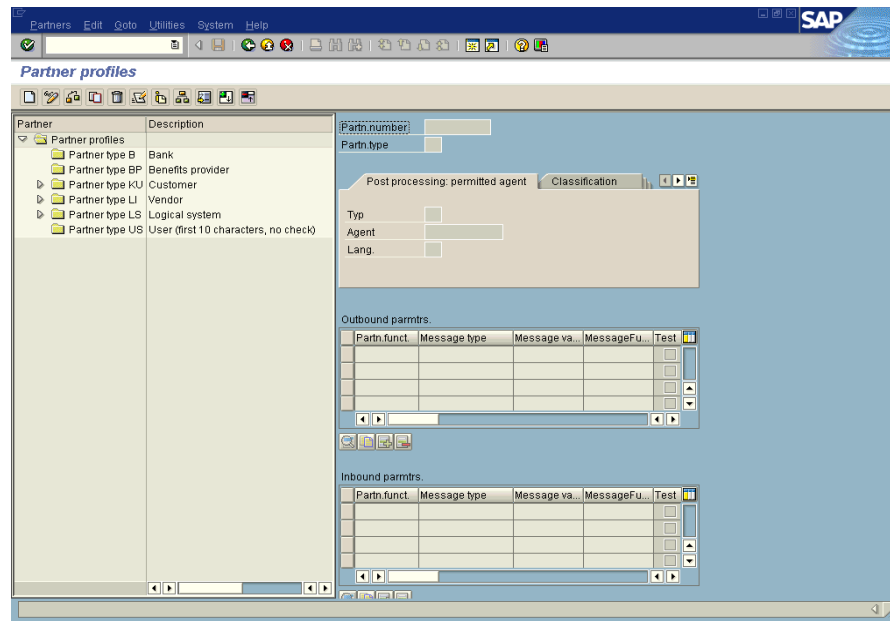

Defining a Partner Profile

To define a partner profile:

1. Execute the **we20** transaction.

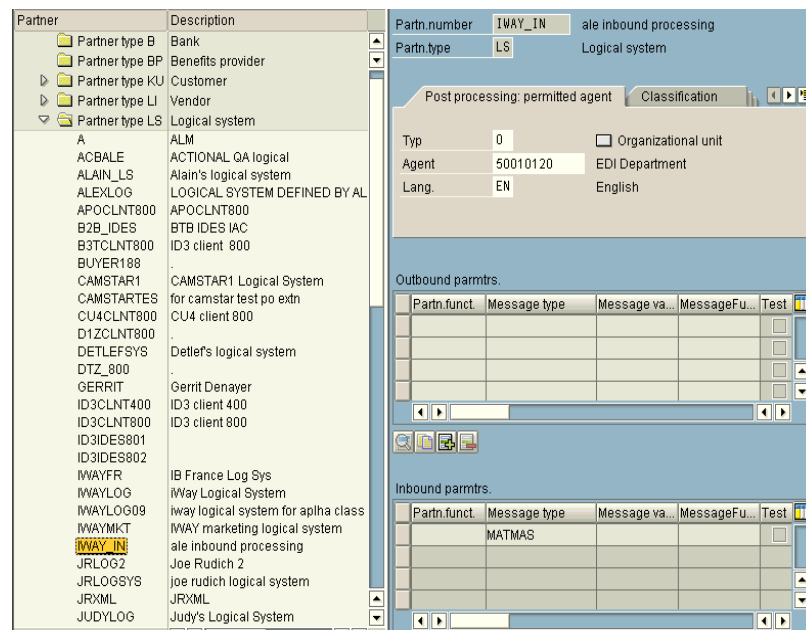

The Partner profiles window is displayed.

- In the left pane, expand **Partner type LS** and select the logical system you configured from the list, for example, ORACLETDS.

In the right pane, the Partn.number field refers to the name of the logical system.

3. Click **Save**.
4. From the **Inbound** parameters table, click the **Create inbound parameter** icon.
The Partner profiles:Inbound parameters window is displayed.

Partner profiles: Inbound parameters

Partn.number IWAY_IN ale inbound processing

Partn.type LS

Partn.funct.

Message type MATMAS

Message code

Message function ☐ Test

Inbound options Post processing: permitted agent Telephony

Process code MATM

☒ Syntax check

Processing by function module

☐ Trigger by background program

☒ Trigger immediately

5. In the **Message type** field, enter the message type you want to use, for example, MATMAS.

You can click the icon to the right of each field to browse from a list of available message types.

The Inbound options tab is selected by default.

6. In the **Process code** field, enter the process code you want to use, for example, MATM.

You can click the icon to the right of each field to browse from a list of available process codes.

7. In the **Processing by function module** area, select one of the following options:

- Trigger by background program.

In this case the adapter writes IDocs to the SAP database, which is processed immediately.

- Trigger immediately.

In this case, the adapter waits for the SAP system to process IDocs. This can take anywhere from 1 to 15 minutes.

8. Click **Save**.

Configuring SAP Outbound Processing

Event creation must be implemented by you or by SAP. An event is created from specific application programs (the event creator) and then published systemwide. Any number of receivers can respond to the event with their own response mechanisms. An event is usually defined as a component of an object type.

SAP pseudo events are not processed by the SAP Event manager, but are called from an ABAP program or Remote Function Call (using the Destination parameter).

Related Concepts and Terminology

The following topic lists and defines specific terminology related to SAP and SAP event handling.

Client and Server Programs

RFC programs for non-SAP systems can function as either the caller or the called program in an RFC communication. There are two types of RFC programs:

- RFC Client
- RFC Server

The RFC client is the instance that calls the RFC to execute the function that is provided by an RFC server. The functions that can be executed remotely are called RFC functions, and the functions provided by the RFC API are called RFC calls.

SAP Gateway

The SAP Gateway is a secure application server. No connections are accepted unless they have been preregistered previously from the SAP presentation Client. A server connection presents itself to the Gateway and exposes a Program Identifier. If the Program Identifier is found in the list of registered Program IDs, the Gateway server then offers a connection to the server, which "Accepts" a connection. This ProgramID is then linked with an RFC Destination within SAP, which enables SAP Function Modules and ALE documents (IDocs or BAPI IDocs) to be routed to the destination. The RFC Destination functions as a tag to mask the Program ID to SAP users.

An RFC server program can be registered with the SAP gateway and wait for incoming RFC call requests. An RFC server program registers itself under a Program ID at an SAP gateway and not for a specific SAP system.

In SAPGUI, the destination must be defined with transaction SM59, using connection type T and Register Mode. Moreover, this entry must contain information on the SAP gateway at which the RFC server program is registered.

Program IDs and Load Balancing

If the Gateway Server has a connection to a particular server instance and another server instance presents itself to the gateway, then the gateway offers the connection and then begins functioning in Load Balancing mode. Using a proprietary algorithm, the Gateway sends different messages to each server depending on demand and total processing time. This may cause unpredictable results when messages are validated by schema and application.

When configuring multiple events in the Oracle Application Server using a single SAP program ID, SAP load balances the event data. For example, if multiple remote function calls or BAPIs use the same program ID (for example, ORACLETDSD) and multiple SAP listeners are configured with this programID, then SAP sends one request to one listener and the next to another listener, and so on.

There is a load-balancing algorithm present in the SAP Gateway Server. This mechanism is proprietary to SAP application development and might work by comparing total throughput of the connection, the number of times in wait state, and so on. This means one connection might receive nine messages and a second connection might receive one message. If five of the nine messages are rejected for

schema validation and the one message on the other connection is rejected for schema validation, you might suspect that you are missing SAP event handling messages.

Load balancing in server (inbound to adapter from SAP) situations is handled by connecting multiple instances of the adapter to the SAP system. The SAP system will then load balance the connections. You cannot tune this performance.

Load balancing in client (outbound from adapter to SAP) situations is handled only by the SAP application design. If your system supports a Message Server, then you can load balance in client situations. If you have only one application server, you cannot load balance except by application server tuning, such as maximum number of connections permitted or time of day limits on connections.

The SAP system default limit is 100 RFC (communication) or adapter users. Each user takes up more than 2 MB of memory on the application server of the SAP system, and more or less on the adapter depending on the workload.

Connection Pooling

A connection pool is a set of client connections to a specific destination. The pool may automatically create new connections to the specified remote system or return an already existing connection. It also provides methods to return a connection back to the pool when it is no longer needed.

A connection pool can check which connections are no longer in use and can be closed to save system resources. The time period after which the pool checks the connections as well as the time after which a connection will time out can be configured by the calling application.

A pool is always bound to one user ID and password, meaning that all connections taken from this pool will also use these credentials. An SAP connection is always bound to an SAP user ID and an SAP Client number.

If you log on with a pool size that is set to 1, no connection pool is created (1 userid – 1 process thread). If you log on with a pool size that is greater than 1, a pool is created with a size of n, which is the number you specified.

For more information about connection pooling, see the SAP JCO API documentation.

Registering Your Program ID in SAPGUI

To enable your SAP system to issue the following calls or interfaces to the SAP event adapter, you must register your program ID under an RFC destination.

- Remote Function Calls (RFC)
- Business Application Programming Interfaces (BAPI)
- Intermediate Documents (IDoc)

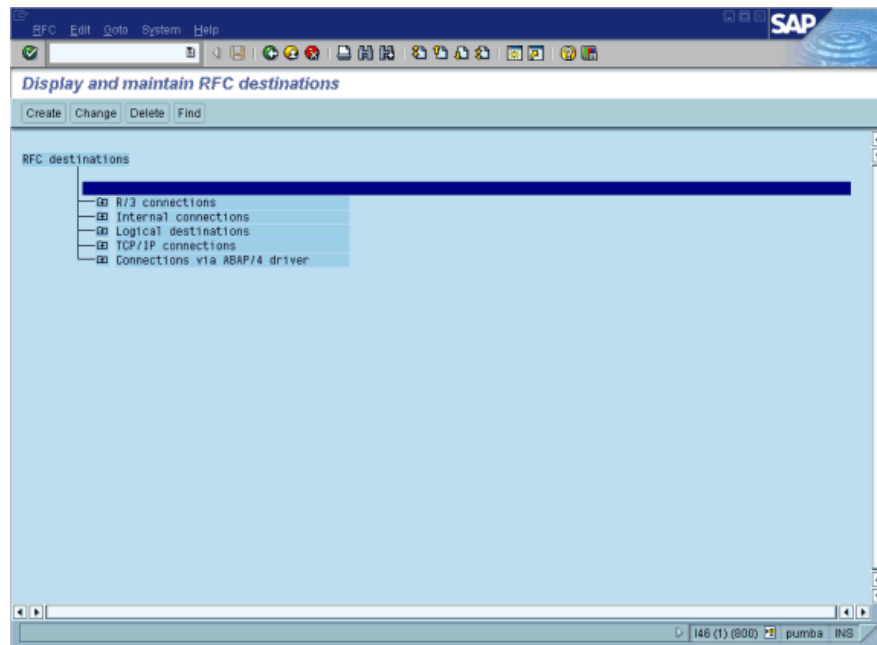

The RFC destination is a symbolic name (for example, ORACLETDS) that is used to direct events to a target system, masking the program ID. The Program ID is configured in both SAPGUI and the event adapter.

Registering Your Program ID

To register your program ID:

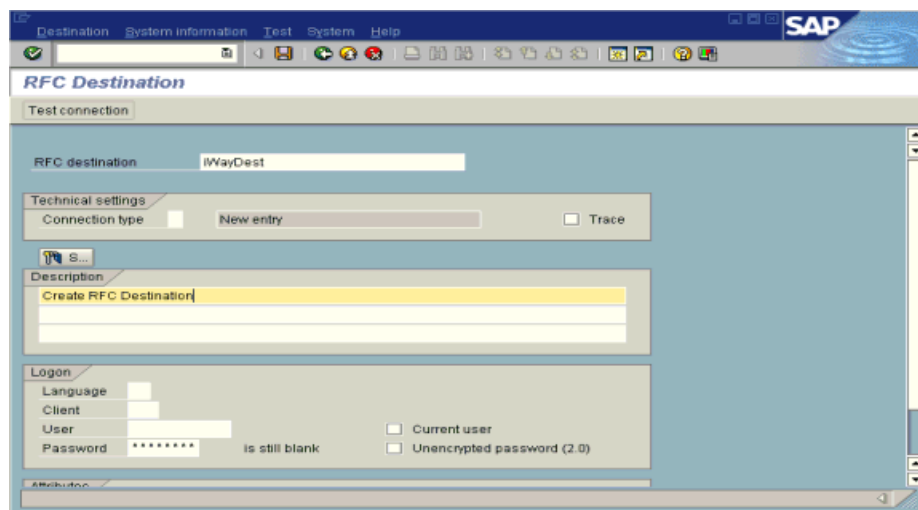

1. Launch the SAP GUI and log in to the SAP system.
2. Select **Tools, Administration, Network**, and then **RFC destination**.
3. Execute the **SM59** transaction.

The Display and maintain RFC destinations window is displayed.

4. Select **TCP/IP connections** and click **Create**.

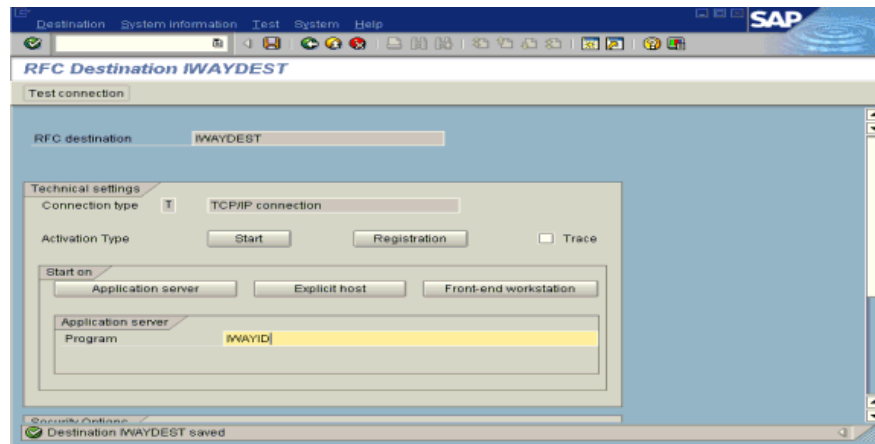

The RFC Destination window is displayed.

Provide the following information:

- a. In the **RFC destination** field, enter a name, for example, **ORACLETDS**.
The value you enter in this field is case sensitive.
 - b. In the **Connection type** field, enter **T** for destination type TCP/IP.
 - c. In the **Description** field, enter a brief description.
5. Click **Save** from the tool bar or select **Save** from the Destination menu.

The RFC Destination ORACLETDS window is displayed.

Perform the following steps:

- a. For the **Activation Type**, click **Registration**.
- b. In the **Program** field, enter **ORACLETDS**.
6. Click **Save** from the tool bar or select **Save** from the Destination menu.
7. Ensure your event adapter is running.
8. Verify that the SAP system and OracleAS Adapter for SAP are communicating.
9. Click **TestConnection**.

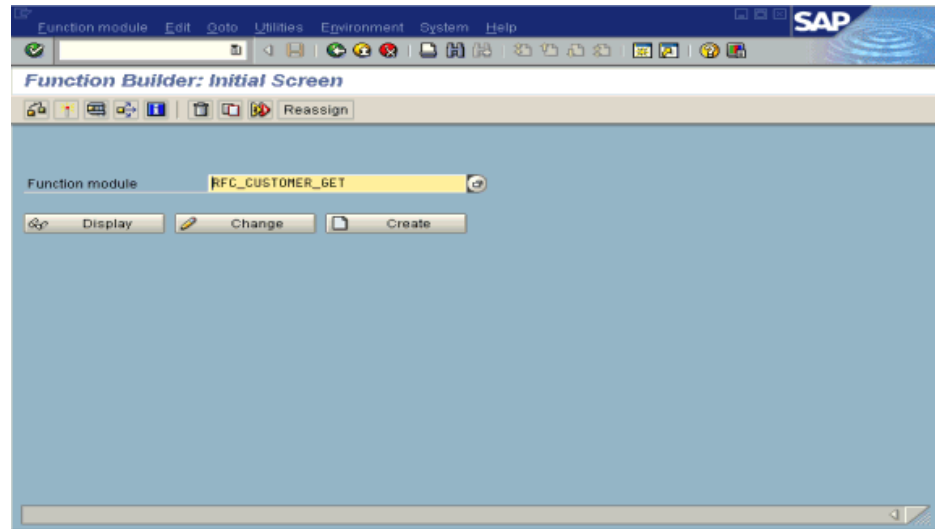

Testing the SAP Event Adapter

In the SAP Server, the SE37 transaction enables you to send an RFC (Remote Function Call) or a BAPI (Business Application Programming Interface) to any RFC destination. For more information on RFC destination, see [Registering Your Program ID in SAPGUI](#) on page A-10.

Testing the SAP Event Adapter by Sending an RFC or a BAPI Manually

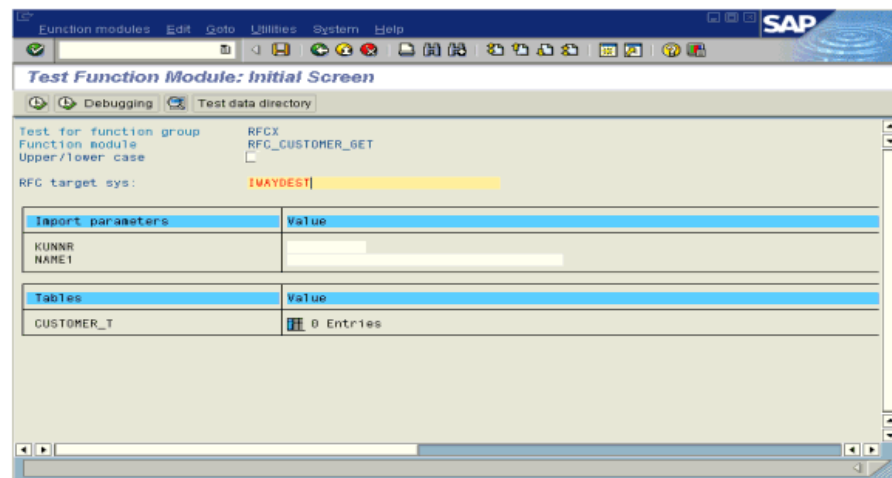

To test the SAP event adapter:

1. In the Function Builder, select a function module, for example, RFC_CUSTOMER_GET.

2. To choose single test, press **F8** and click the **Single Test** icon or choose **Function module**, select **Test** and then **Single Test**.
3. Enter an RFC target system, for example, ORACLETD5.
4. Enter input data for the particular RFC modules, for example, AB*.
5. To execute, press **F8**.

The Test Function Module: Initial Screen window is displayed.

6. Enter data into the SAP GUI and click **Execute**.

The function name and input data are transferred through RFC to create an XML document on the Oracle Application Server with the parameters input in SAPGUI.

Application Link Embedding Configuration for the Event Adapter

The SAP event adapter receives IDocs (Intermediate Documents) from SAP. To configure an SAP system to send IDocs to the SAP event adapter, use the ALE (Application Link Embedding) configuration to:

1. Register your program ID in SAPGUI.

2. Define a port.
3. Create a logical system.
4. Create a partner profile.
5. Create a distribution model for the partner and message type.
6. Test the SAP event adapter.

Defining a Port

A port identifies where to send messages. This port can be used only if an RFC destination was created previously.

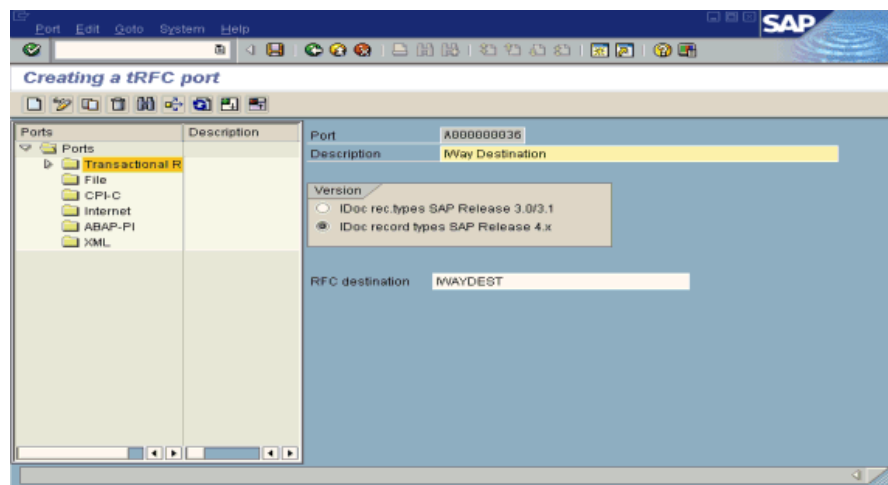

Defining a Port

To define a port:

1. In the ALE configuration, choose **Tools, Business Communications, IDocs Basis, IDoc**, and then **Port Definition**.

You can also execute the WE21 transaction.

The Creating a tRFC port window is displayed.

2. In the left pane under **Ports**, select **Transactional RFC** and click **Create**.
3. Select **Generate port name**.
The system generates the port name.
4. Enter the IDoc version you want to send through this port.
5. Click the destination you created, for example, ORACLETDS.
6. Save the session, making note of the system-generated RFC port.

Creating a Logical System

One type of partner is a logical system. A logical system manages one or more RFC destinations.

Creating a Logical System

To create a logical system called ORACLETDS:

- The Change View "Logical Systems": Overview window displays a list of logical systems and their names.

The screenshot shows the SAP 'New Entries: Overview of Added Entries' window. The interface includes a menu bar with options: Table view, Edit, Goto, Selection criteria, Utilities, System, and Help. A toolbar with various icons is located below the menu. The main content area features a table with two columns: 'Log System' and 'Name'. The first row of the table is highlighted in yellow. At the bottom of the window, there is a 'Position...' button and the text 'Entry 0 of 0'.

- Configuring SAP for Inbound and Outbound Processing
- A-15**

Creating a Partner Profile

A partner profile is a definition of parameters for the electronic interchange of data with a trading partner using the IDoc interface.

To communicate with a partner using the IDoc interface, you must create a partner profile.

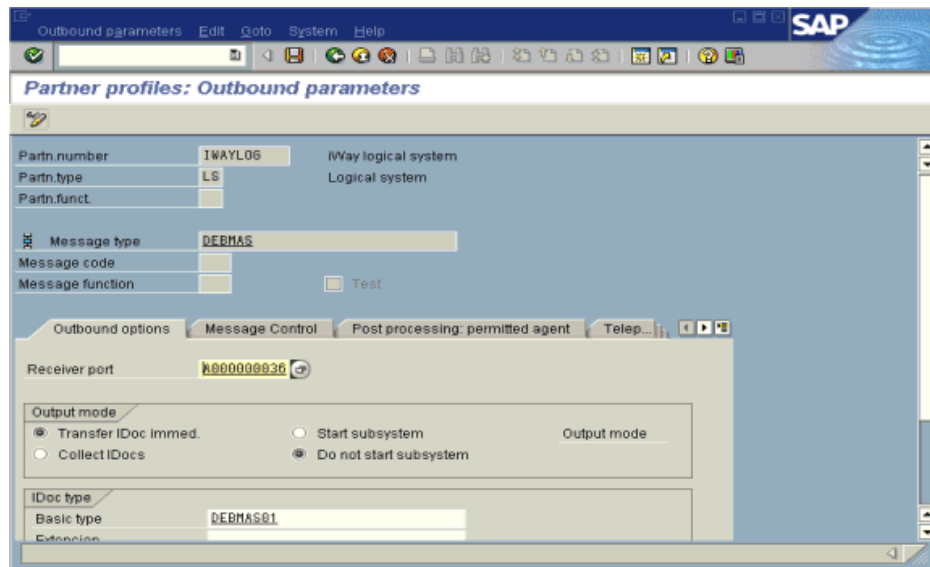

Creating a Partner Profile

To create a partner profile:

1. In SAP GUI, choose **Tools, Business Communication, IDoc Basis, and Partner profile**.

You can also execute the WE21 transaction.

The Partner profiles: Outbound parameters window is displayed and shows fields for specifying details for the partner profile.

Perform the following steps:

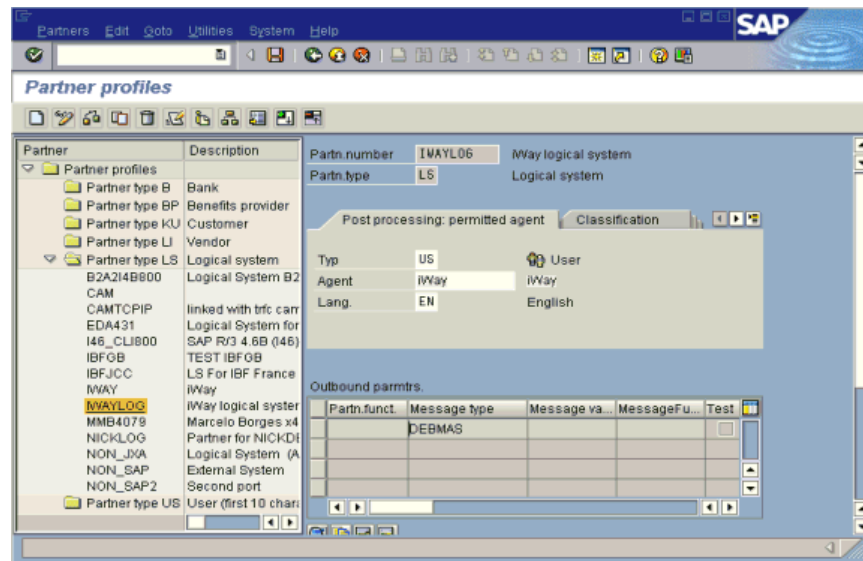

- a. Select Partner type **LS** (Logical system).
 - b. Press **F5** (Create).
2. For Type, enter **USER**.
 3. For Agent, enter the current user ID, or you may select another agent type.
 4. Under the outbound parameter table control, select **Create outbound parameter**.
Partn.type is **LS**, and the Message type is **DEBMAS**, which is the IDoc document type.
 5. Leave **Partn.funct** blank.
 6. Click the **Outbound options** tab.

Provide the following information:

- a. Depending on your performance requirements, click **Transfer IDoc Immed** or **Collect IDocs**.
- b. For the IDoc, enter a message type, for example, **DEBMAS**.

- c. Enter a receiver port, for example, A000000036.
7. Click **Save** to save the session.

The Partner profiles summary window is displayed. It contains information for the logical system that you created.

Collected IDocs

When using collected IDocs on any platform during inbound processing (service mode), if the DOCNUM field does not have a unique document number for each IDoc, the system creates an IDoc for each header record in the collected IDoc file and duplicates the data for each IDoc.

Make sure the DOCNUM field is included in the EDI_DC40 structure and that each IDoc has a unique sequence number within the collected IDoc file.

Creating a Distribution Model for the Partner and Message Type

You must create a distribution model for the partner and message type you designated.

Creating a Distribution Model

To create a distribution model called ORAMOD:

1. In SAP GUI, choose **Tools, AcceleratedSAP, Customizing**, and then **Project Management**.

You can also execute the BD64 transaction.

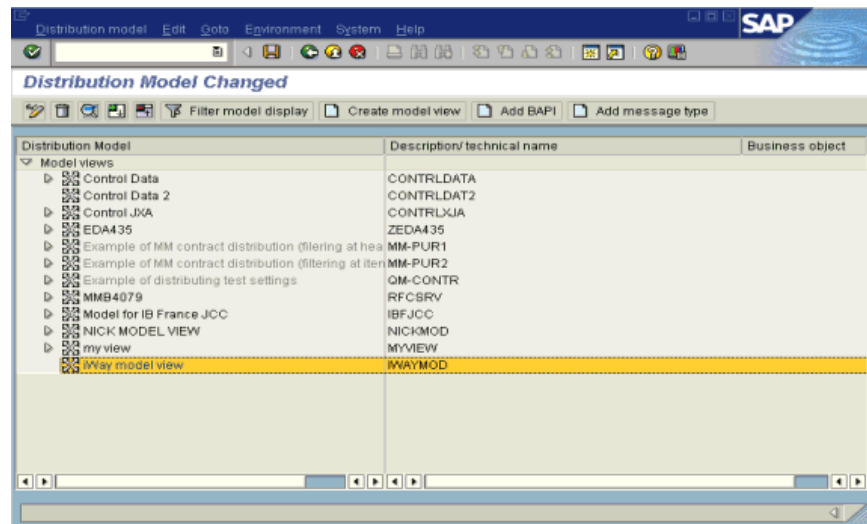

The Display Distribution Model window is displayed.

2. Select **Create model view**.

If required, switch the processing mode to edit within Distribution Model/Switch Processing Mode.

3. Enter a short text string and a technical name for your new model view.
4. Click **Save**.

The Distribution Model Changed window is displayed, showing a tree structure of the distribution model.

Perform the following steps:

- a. In the Distribution Model tree, select a new model view.
- b. On the right, select **Add message type**.

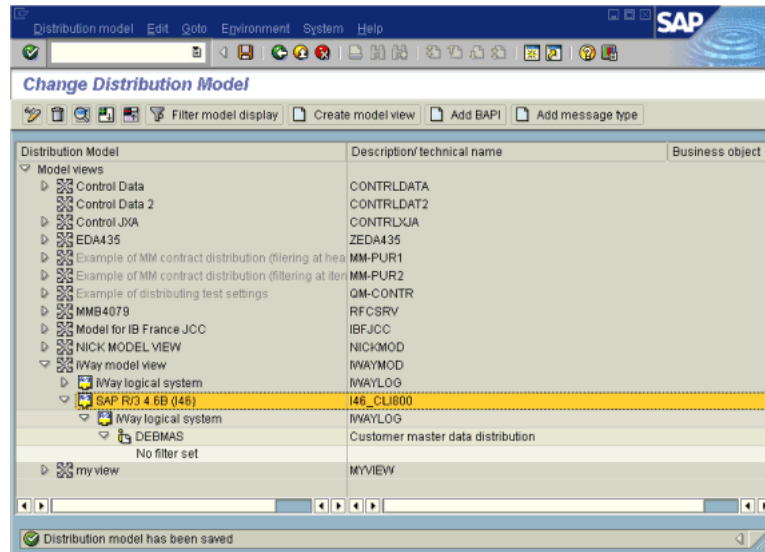

The Add Message Type box is displayed. It contains fields for specifying the sender and receiver of the message, as well as the message type.

Provide the following information:

- a. In the **Sender** field, provide the sender that points to the SAP system, which sends the IDoc, for example, I46_CLI800.
In this case, the sender is an SAP 4.6B system.
- b. In the **Receiver** field, provide the logical system, for example, ORACLETDS.
- c. In the **Message type** field, provide the type of IDoc, for example, DEBMAS.
5. Click the **check mark** icon.
6. Click **Save**.

The Change Distribution Model window displays the new model view to use to send message type, DEBMAS, from the I46_CLI800 SAP system to the ORACLETDS logical system.

You are now ready to test the connection to the logical system.

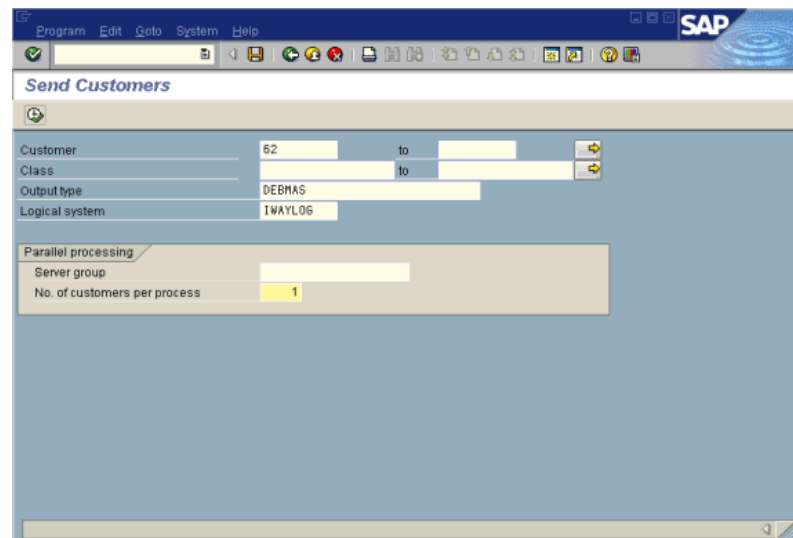

Testing the SAP ALE Configuration

In the SAP Server, the BD12 transaction enables you to send IDocs to any logical system, for example, to an event adapter.

Testing the SAP ALE Configuration

To test the SAP Application Link Embedding (ALE) configuration:

1. In the Send Customers window, enter the IDoc message type, for example, DEBMAS in the **Output type** field.

2. In the **Logical system** field, enter the logical system, for example, ORACLETDS.
3. Click **Run**.

The SAP event adapter receives the IDoc in XML format. No response is expected from the event adapter.

A confirmation window is displayed.

Glossary

adapter

Provides universal connectivity by enabling an electronic interface to be accommodated (without loss of function) to another electronic interface.

agent

Supports service protocols in listeners and documents.

business service

Also known as a Web service. A Web service is a self-contained, modularized function that can be published and accessed across a network using open standards. It is the implementation of an interface by a component and is an executable entity.

channel

Represents configured connections to particular instances of back-end systems. A channel binds one or more event ports to a particular listener managed by an adapter.

listener

A component that accepts requests from client applications.

port

Associates a particular business object exposed by the adapter with a particular disposition. A disposition is a URL that defines the protocol and location of the event data. The port defines the end point of the event consumption.
